OpenROAD v1.0 Expectations

Andrew B. Kahng and Tom Spyrou
The OpenROAD Project

November 22, 2019

Web: https://theopenroadproject.org/
GitHub: https://github.com/The-OpenROAD-Project

The OpenROAD v1.0 tool, to be released in July 2020, will be capable of push-button, DRC-clean RTL-to-GDS layout generation in a commercial FinFET process node. The tool is currently visible here. In its v1.0 form, it will be integrated on an incremental substrate provided by the OpenDB database and the OpenSTA static timing engine. It will also offer users and

Flow components

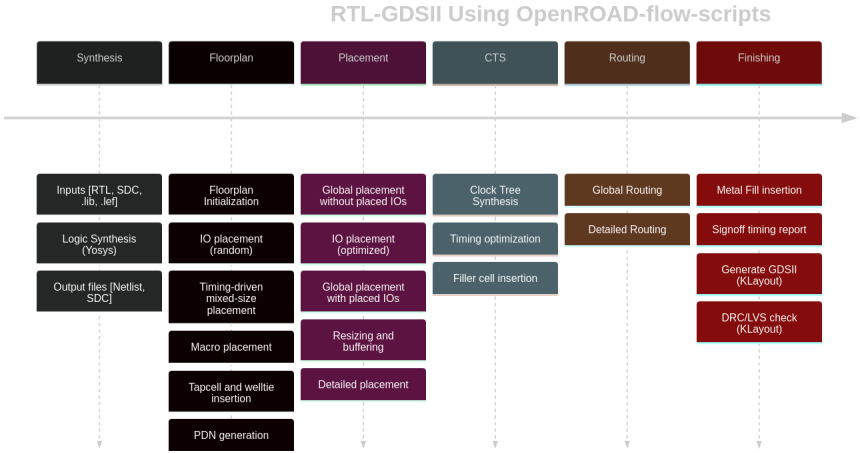

Figure 9: OpenROAD flow components [9]

Section 3

Fill insertion

Fill insertion

There are two flow components that take care of filling area gaps in the design:

- Filler cell insertion
- Metal fill insertion

Both will be explained in the following section.

Filler cells: Reasons

Why filling the design area with more cells?

- After floorplaning and placement there will always be gaps between the standard cells
- These gaps must be filled to keep the continuity of
  - n-well and p-well spacing
  - railing
  - implants
- The filling with cells helps against the WPE (well proximity effect)

Filler cells: Properties

Filler cells

- have no logic function
- have no inputs and no outputs
- are not in the netlist of the design
- are available in different widths

Filler cells: GDS

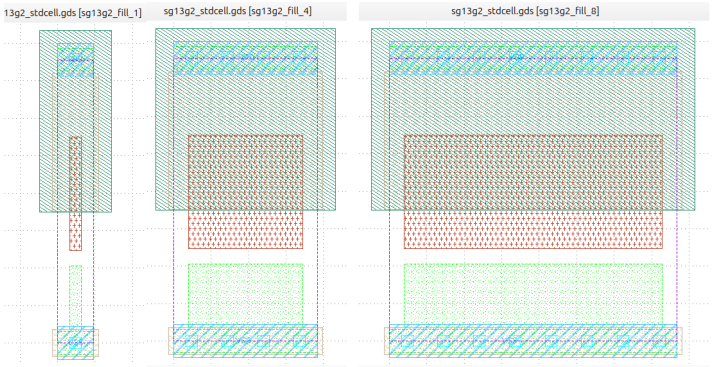

Figure 10: Filler cells in different widths (1, 4, 8)

Metal fill

What is metal filling?

- Metal filling adds polygons and shapes to the metal layer(s).
- These fillings have no logic functionality.
- The purpose is creating a more even or uniform distribution of the metal area.
- Physical reasons are planarity and reducing thinkness variations (CMP).
- Metal filling can affect timing and signal integrity.
- Metal filling is done algorithmical (mostly with scripts).

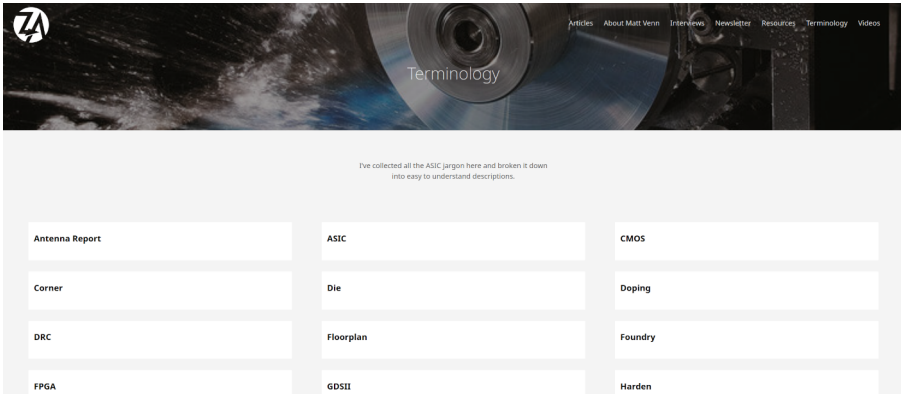
Section 4

Resources

Help with the terminology

Searching the terms with a standard search engine might not bring usefull results every time. Matt Venn created a page for EDA terminology:

https://www.zerotoasiccourse.com/terminology/



The list of open-source tools

The list of flow steps and flow components in ORFS contains the information about the original open-source tools.

We will dive a little deeper into this list with the course training:

https://openroad-flow-scripts.readthedocs.io/en/latest/tutorials/FlowTutorial.html#running-the-automated-rtl-to-gds-flow

Meet the developers

There is a slack community with most of the open-source silicon projects and people in it:

https://open-source-silicon.dev

This is the perfect place, if you

- search for people you heard of in open-source EDA.
- want to reach out to tool developers.
- have all sorts of questions in open-source EDA.
- look for a specific problem and want to see if others already are in a discussion about it.
- want to share your experience and help others.

Most of the tools in open-source EDA have their own channel in this slack. Just try search and add for the channel names.

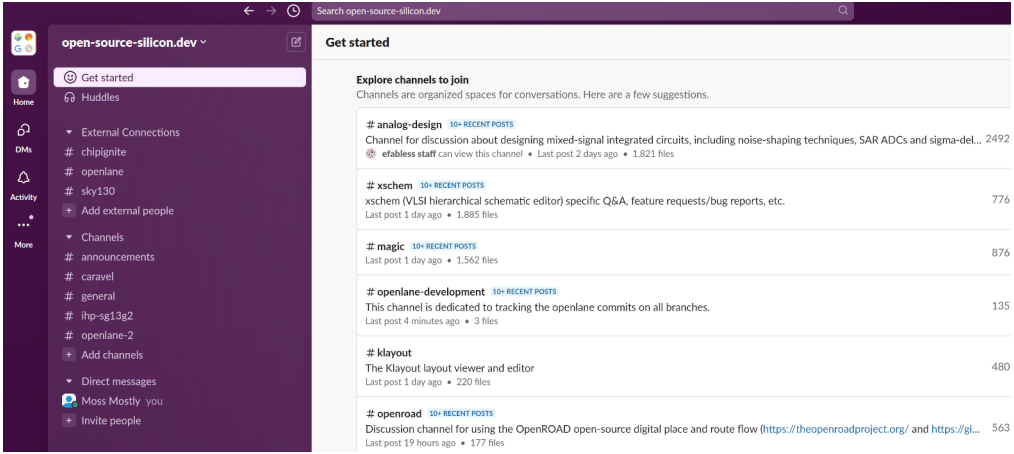

Figure 12: Channels in the open-source-silicon.dev slack
