- 6 Ruleset documents

Section 1

What is a PDK?

Wikipedia definition

A process design kit (PDK) is a set of files used within the semiconductor industry to model a fabrication process for the design tools used to design an integrated circuit. The PDK is created by the foundry defining a certain technology variation for their processes. ...

... The designers use the PDK to design, simulate, draw and verify the design before handing the design back to the foundry to produce chips. The data in the PDK is specific to the foundry's process variation and is chosen early in the design process, influenced by the market requirements for the chip. An accurate PDK will increase the chances of first-pass successful silicon.

Source: https://en.wikipedia.org/wiki/Process_design_kit

Open-source viewpoint

- Semiconductor industry started to integrate open-source.
- Open-source PDKs created by Semiconductor Fabs were a “missing link” between:
 - Open-source EDA tools (RTL-to-GDS) and
 - Microchip production (GDS-to-Chip)
- Since there is open-source PDKs, the growth of the open-source ecosystem is measurable.
- Many of the tools have been the classical “one-person maintained” open-source projects. It is getting better.

In the context of this course

The PDK (ihp-sg13g2) integrates seamless (to the user) into the OpenROAD flow scripts toolchain.

We have seen reference points from the tools onto the PDK in:

- the configuration files
- the structure of the design directories
- some Variables

Naming

PDKs sometimes are referred to as:

- Process design kits
- Process node
- Technology node
- Technology

Section 2

Open-Source PDK and GitHub

Difference from closed source

With publishing a PDK under a open-source license, the development from there on becomes a worldwide visible joint effort. The number of contributors and authors of the PDK can only increase from here on.

Collaborative workflow in GitHub

Some of the main principles of open-source are the permissions to use, study, change and re-distribute the published code and data according to the license. This leads to a open collaboration in which everyone can participate.

GitHub enables a workflow that was designed and build with these principles and opportunities in mind. A good starting point to explore the open collaboration in the IHP PDK are

- Issues (open and closed)
- Pull requests (open and closed)

The topics and discussions that you can read and study there will draw a picture of how the process of open collaboration works for the PDK.

The README

The Readme file in the PDKs repository is the starting point for information about the content of the PDK.

<https://github.com/IHP-GmbH/IHP-Open-PDK/blob/main/README.md>

IHP Open Source PDK

130nm BiCMOS Open Source PDK, dedicated for Analog/Digital, Mixed Signal and RF Design

IHP Open Source PDK project goal is to provide a fully open source Process Design Kit and related data, which can be used to create manufacturable designs at IHP's facility.

As of March 2023, this repository is targeting the SG13G2 process node.

Tool support

The PDK supports a bunch of tools with the included file formats. A list of the file types and formats follows later in this chapter.

The main tools for this course are

- OpenROAD flow scripts
- OpenROAD
- KLayout

The list of supported tools from the README in the PDK:

Supported EDA Tools

- ngspice

Figure 6: Supported tools

Cells in the PDK

There are four different sets of cells (or devices) in the PDK:

- Base cellset with limited set of standard logic cells
 - CDL, GDSII, LEF, Tech LEF
 - Liberty, SPICE Netlist, Verilog
- IO cellset
 - GDSII, LEF, Liberty (dummy), SPICE Netlist
- SRAM cellset
 - CDL, GDSII, LEF, Liberty, Verilog
- Primitive devices
 - GDSII

Other data in the PDK

- KLayout tool data:
 - layer property and tech files
 - DRC rules (minimal set)
 - PyCells
 - initial version of the wrapper API
 - sample cells
- Pcells (for reference only) `libs.tech/pycell`
- MOS/HBT/Passive device models for `ngspice/Xyce`
- `xschem`: primitive device symbols, settings and testbenches
- OpenEMS: tutorials, scripts, documentation
- SG13G2 Process specification & Layout Rules
- MOS/HBT Measurements in MDM format
- Project Roadmap Gantt chart

Layer stack

IHP sg13g2 Layers in a picture. [Source PDF](#)

Design rules

- The DRC (design rules check) with ORFS happens in KLayout.
- The data for the minimal and maximal checks is here:

Cell AO21: Schematic in XScheme

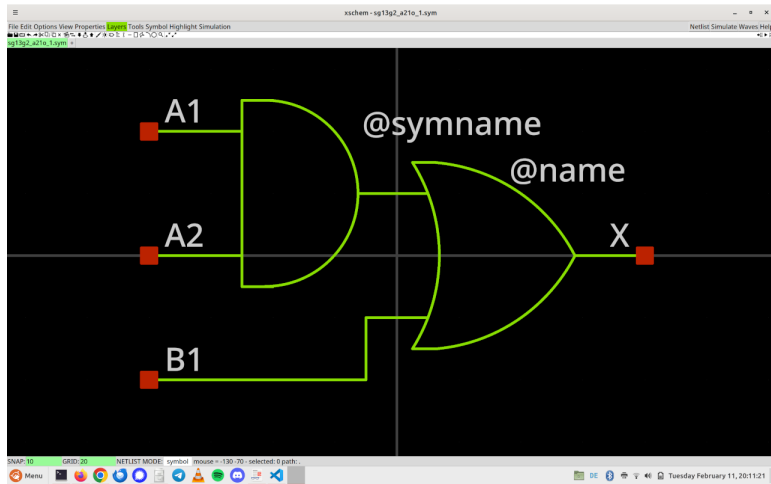

Figure 11: AO21 in XScheme

Liberty files

- Liberty files (.lib) contain information about timing, power and temperature of the cells.
- The ihp130-sg13g2 PDK contains six different Liberty files for the standard cells.
- These six files are categorized by nominal voltages and nominal temperatures:

Liberty file	Voltage	Temperature
sg13g2_stdcell_fast_1p32V_m40C.lib	1.32 V	-40° C
sg13g2_stdcell_fast_1p65V_m40C.lib	1.65 V	-40° C
sg13g2_stdcell_slow_1p08V_125C.lib	1.08 V	125° C
sg13g2_stdcell_slow_1p35V_125C.lib	1.35 V	125° C
sg13g2_stdcell_typ_1p20V_25C.lib	1.20 V	25° C
sg13g2_stdcell_typ_1p50V_25C.lib	1.50 V	25° C

- The PDK contains .lib files for RAM macros and io cells too.

Cell AO21: Liberty description

- The cell AO21 (first cell in the standard cell library list) has 622 lines of data in the lib file.
- The cell description contains:
 - First comes the leakage power for the whole truth table on the inputs.
 - After that each pin gets described with its timing and power characteristics
 - The order of the pins starts with the output. Order: X, A1, A2, B1

Cell AO21: Liberty file extract:

```
1  cell (sg13g2_a21o_1) {
