

# Chapter 0 - Preparations

## Before the course (Optional)

Course authors (Git file)

- 1 Description
- 2 Install Option A: OpenROAD Flow Scripts (ORFS) on your computer
- 3 Install Option B: IIC-OSIC-TOOLS in a docker container on your computer
- 4 Install Option C: Guide to use an IHP server with installed EDA tools

## Section 1

Description

# Description

Before the course starts, you can take some optional preparations regarding the open-source EDA software tools that will be used during the course. Either you can install them locally on your own computer or get access to a preconfigured server from IHP.

Here comes a short description of the three options, followed by their detailed guides:

## Option A: OpenROAD Flow Scripts (ORFS) on your computer

- A plain installation of OpenROAD, Yosys, Klayout and some flow scripts into your system.
- This option puts everything directly under your control and only installs the minimum toolset necessary for the course.
- It requires the permissions to install software on your computer.
- The guide makes use of Ubuntu Linux.

## Option B: IIC-OSIC-TOOLS in a docker container on your computer

- This docker container is like a swiss knife for EDA tools. It can be configured in many ways and contains a lot of useful tools.
- All the tools for the course are in it.
- It requires the permissions to install software on your computer.
- The guide makes use of Ubuntu Linux.

## Option C: IHP server with installed tools

- Working on the IHP server is the more convenient approach and does not require to install anything on your computer.
- The tools are ready to use installed on the IHP server.
- A permanent connection to the server is needed (reliable internet connection).
- This option will work on various computers and operating systems (Linux/Win/Mac).

## Section 2

Install Option A: OpenROAD Flow Scripts (ORFS) on your computer

# Install Option A: OpenROAD Flow Scripts (ORFS) on your computer

- This guide is a list of shell commands with some short explanations and weblinks.
- This was tested on a freshly installed Ubuntu LTS 24.04.1.
- The order of the commands is crucial and must not be skipped.
- For more explanations look into the documentations and README files of the tools. The weblinks are given.

## Prerequisites:

- Ubuntu LTS 24.04.1 (should work on other Linux too, see weblink)
- Permission to install software (sudo rights)
- Reliable internet connection
- git installed: `sudo apt install git`

Weblink for detailed information:

<https://github.com/The-OpenROAD-Project/OpenROAD-flow-scripts/blob/master/docs/user/BuildLocally.md>

## Your install folder

Navigate to a folder where you want the installation to reside in. The install will need some Gigabytes space.

```
1 | cd <INSERT PATH TO YOUR INSTALL FOLDER HERE>
```

## Clone the ORFS repo

Clone the repository to your computer:

```
1 | git clone --recursive https://github.com/The-OpenROAD-Project/OpenROAD-flow-scripts
```

## Run the setup script

Run the setup script to install the dependecies:

```
1 | cd OpenROAD-flow-scripts
```

```
1 | sudo ./setup.sh
```

## Build the tools

Build all tools. This will take a while, depending on the computer:

```
1 | ./ build_openroad.sh --local
```

## Verify the builds

Verify that the tools are available. You should get version informations of the tools with the following commands:

```
1 | source ./env.sh
```

```
1 | klayout -v
```

```
1 | yosys --version
```

```
1 | openroad -version
```

## Section 3

Install Option B: IIC-OSIC-TOOLS in a docker container on your computer

# Install Option B: IIC-OSIC-TOOLS in a docker container on your computer

- This guide is a list of shell commands with some short explanations and weblinks.
- This was tested on a freshly installed Ubuntu LTS 24.04.1.
- The order of the commands is crucial and must not be skipped.
- For more explanations look into the documentations and README files of the tools. The weblinks are given.

## Prerequisites:

- Ubuntu LTS 24.04.1
- Permission to install software (sudo rights)
- Reliable internet connection

## The IIC-OSIC-TOOLS docker container:

With the following steps a preconfigured docker gets installed. The docker is created and maintained by: Institute for Integrated Circuits (IIC) at the Johannes Kepler University Linz (JKU) and is available in their Github with more detailed installation instructions:  
<https://github.com/iic-jku/IIC-OSIC-TOOLS>

## Step 1: Install docker with apt:

Weblink for detailed informations:

<https://docs.docker.com/engine/install/ubuntu/#install-using-the-repository>

Add Docker's official GPG key:

```
1 | sudo apt-get update
```

```
1 | sudo apt-get install ca-certificates curl
```

```
1 | sudo install -m 0755 -d /etc/apt/keyrings
```

```
1 | sudo curl -fsSL https://download.docker.com/linux/ubuntu/gpg -o /etc/apt/keyrings/docker.asc
```

```
1 | sudo chmod a+r /etc/apt/keyrings/docker.asc
```

## Add the repository to apt sources:

```
1 echo \  
2   "deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.asc]  
3     https://download.docker.com/linux/ubuntu \  
4     $(. /etc/os-release && echo "$VERSION_CODENAME") stable" | \  
5     sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
```

```
1 sudo apt-get update
```

## Install the latest version of docker:

```
1 | sudo apt-get install docker-ce docker-ce-cli containerd.io docker-buildx-plugin docker-compose-plugin
```

## Step 2: Manage docker as a non-root user

Weblink for detailed informations:

<https://docs.docker.com/engine/install/linux-postinstall/#manage-docker-as-a-non-root-user>

```
1 | sudo groupadd docker
```

```
1 | sudo usermod -aG docker $USER
```

```
1 | newgrp docker
```

## Step 3: Run the hello-world docker:

Run the hello-world example docker (without the need of sudo user):

```
1 | docker run hello-world
```

No errors should be displayed in running the hello-world example. The output in the shell should contain this message:

```
1 ...
2 Hello from Docker!
3 This message shows that your installation appears to be
4 working correctly.
5
6 To generate this message, Docker took the following steps:
7 1. The Docker client contacted the Docker daemon.
8 2. The Docker daemon pulled the "hello-world" image from
9    the Docker Hub. (amd64)
10 3. The Docker daemon created a new container from that
11    image which runs the executable that produces the
12    output you are currently reading.
13 4. The Docker daemon streamed that output to the Docker
14    client, which sent it to your terminal.
15 ...
```

## Step 4: Clone the IIC-OSIC-TOOLS git repository to your computer:

Weblink for detailed informations about the steps 4 - 5:

<https://github.com/iic-jku/IIC-OSIC-TOOLS/blob/main/README.md>

Install git:

```
1 | sudo apt install git
```

Navigate to a folder where you want the repository to be in:

```
1 | cd <INSERT PATH TO YOUR FOLDER HERE>
```

## Clone the IIC-OSIC-TOOLS:

```
1 git clone --depth=1 https://github.com/iic-jku/iic-osic-tools.git
```

## Step 5: Start the docker

```
1 | ./start_x.sh
```

A shell window pops up, in which the docker runs.

## Step 6: Get the OpenROAD flow scripts

- To be written
- This should be matching to option C (IHP server)
- Waiting on IHP information about their docker / server install.

## Section 4

Install Option C: Guide to use an IHP server with installed EDA tools

## Install Option C: Guide to use an IHP server with installed EDA tools

- This option is still in development.
- Expect updates when it is ready to use.
- Till then it is recommended to take Option A or B.

## Section 3

Course components

# Get the course materials here:

Course materials (Release):

<https://github.com/OS-EDA/Course/releases>

- Download the latest release
- Unpack into a directory
- There might be daily updates during the course week!

## Additional course related links:

OS-EDA Github organization:

<https://github.com/OS-EDA>

Course Github repository:

<https://github.com/OS-EDA/Course>

# Duplicated content versus internet links

The course slides

- contain Links to the Internet for a lot of topics.
- do not contain duplicated content (or as less as possible).

This means:

- Follow the links and read there. It is important content for the course.
- The links are carefully curated. It's not spamming.
- Don't expect all the content being duplicated into the course slides.

A brief discussion about pros and cons of this.

# Lectures

## Lectures:

- All the chapters start with a lecture slide deck.
- The trainer will walk you through the content of the lectures.
- Whenever you have a question inbetween: ask directly.
- The lectures contain the base knowledge of the course.

# Trainings

## Common training tasks:

Every training sessions starts with the common part. The tasks of the common part are sufficient to follow along the content of the course. If you're a beginner, these trainings should be your goal to reach.

## Advanced training tasks:

The advanced training sessions are for those With pre knowledge. If the common training was finished fast or was just to easy, the advanced sessions get you covered.

## Bonus training tasks:

Still time left to do some tasks? Want something to take with you as homework? Please enjoy the bonus rounds of the training sessions.

# Questions

## Questions:

- The questions are for re-visiting and remembering a previous chapter.
- They guide an interactive session between the trainer and the room:
  - Trainer: Asks the questions.
  - Room: Answers the questions.
    - Skipping a question is fine.
    - Not knowing the answer is fine.
    - This is not an exam, not a test and not a challenge.
    - It is meant as a helpfull and hoepfully enjoyable way to recap yesterdays content.
  - If no answer is found, the trainer helps with the answer.

## Section 4

Feedback and Cheat Sheets

# Feedback and Cheat Sheets

- We please you to give us feedback for the course.
- There is a short timeframe each day reserved for feedback.

We have two ideas about this:

- ① Developing Cheatsheets together
- ② Collecting general feedback

# Cheatsheets

Some things are really hard to remember:

- Abbreviations
- Complex relations and graphics
- EDA tools workflow
- Schedule of the week
- Mathematics (joking, we're not doing math here)
- ...

- That is why we would like to develop Cheatsheets with you.
- They're made for cheating the hard parts.
- Cheatsheets work best when printed as handouts.
- One can have them nearby the computer while learning.

# Cheatsheet example

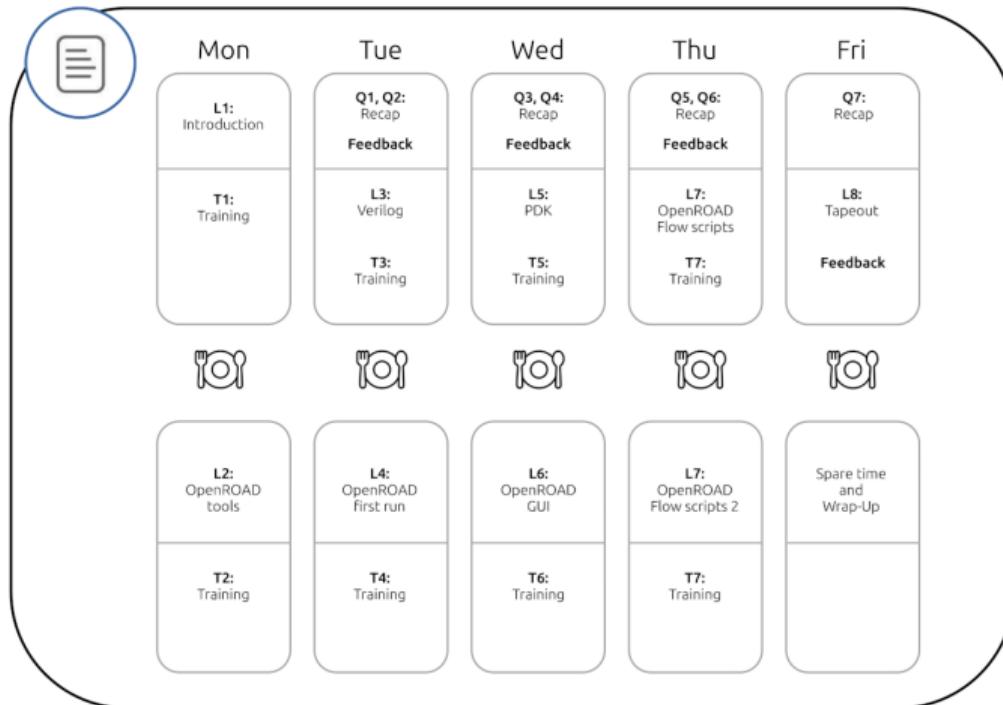

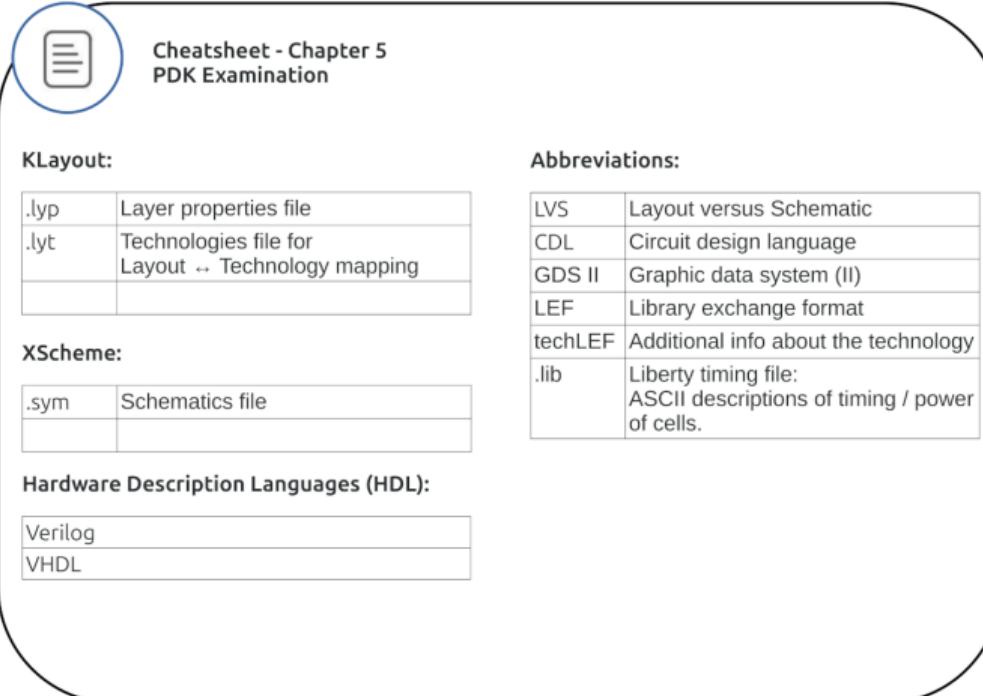

Figure 1: Cheatsheet Chapter 1

# Cheatsheet example

Cheatsheet - Chapter 5  
PDK Examination

**KLayout:**

.lyp	Layer properties file
.lyt	Technologies file for Layout ↔ Technology mapping

**XSchema:**

.sym	Schematics file

**Abbreviations:**

LVS	Layout versus Schematic
CDL	Circuit design language
GDS II	Graphic data system (II)
LEF	Library exchange format
techLEF	Additional info about the technology
.lib	Liberty timing file: ASCII descriptions of timing / power of cells.

**Hardware Description Languages (HDL):**

Verilog
VHDL

Figure 2: Cheatsheet Chapter 5

# Empty Cheatsheet printversion

Figure 3: Cheatsheet Chapter 5

# Empty Cheatsheet document link

Empty Cheatsheet OpenOffice doc:

[https://github.com/OS-EDA/Course/tree/main/Chapter\\_01\\_Introduction/pics\\_lecture](https://github.com/OS-EDA/Course/tree/main/Chapter_01_Introduction/pics_lecture)

# General feedback

General feedback:

- The general feedback will be collected verbally in the room.
- Everyone has the opportunity to give feedback
- We will write down the feedback, without your name.

# What will happen with your feedback?

- We will put the feedback into Github issues.
- Right now, think of Github issues as some sort of tracker- or ticket system.
- Your feedback will not be connected to you (Anonymous).
- You can join a public discussion in the Github issues, if you want to.

Weblink to the issues of the course:

<https://github.com/OS-EDA/Course/issues?q=is%3Aissue>

## Section 5

The Training sessions

# Login at IHP

- Onboarding to the computers for everyone

# Levels

- The Trainings should create success points inbetween lectures
- This is going too slow for me:
  - Try the advanced and bonus trainings (even from past chapters)
- This keeps me busy every minnute:
  - Stick to the common trainings. You will be able to follow all chapters then.

## Section 6

Certificate

# Certificate

We will explain live about the certificate of the course.

## Section 7

Open-source EDA for digital designs

# Digital designs

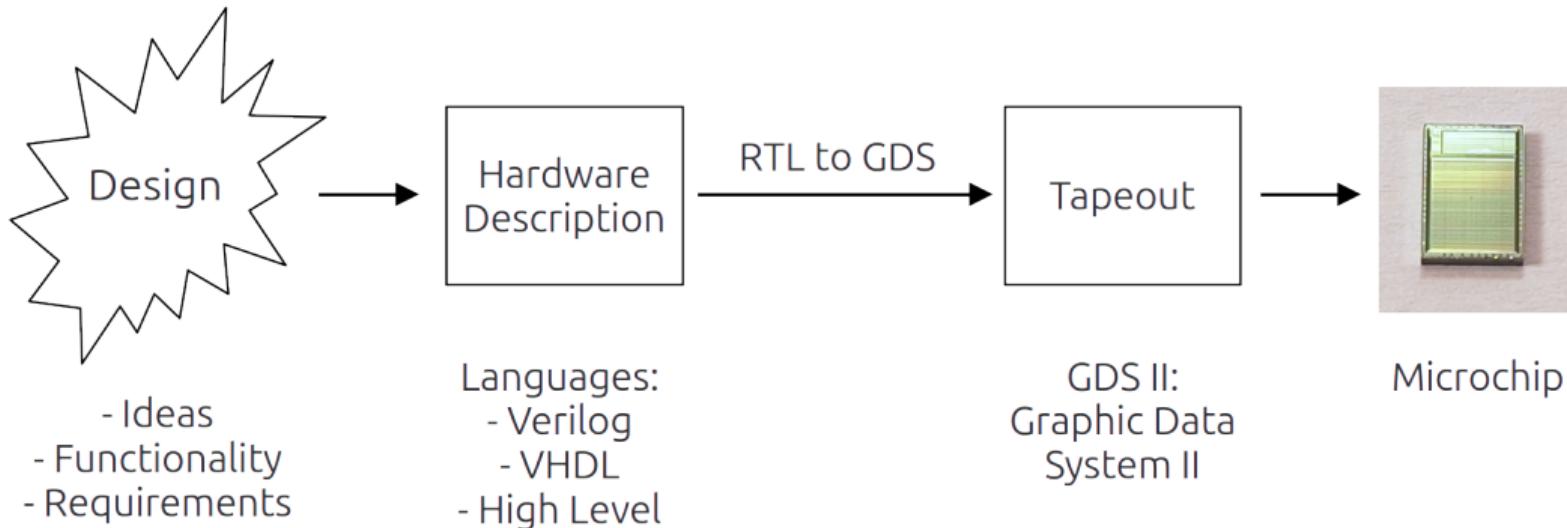

There are:

- **Digital designs** This course!
- Analog designs (Upcoming course)
- Mixed signal designs
- Artwork designs (i.e. Minimal Fab Contest)
  - <https://github.com/mineda-support/Semicon2023-MinimalFab-Design-Contest>
- Your fancy design?

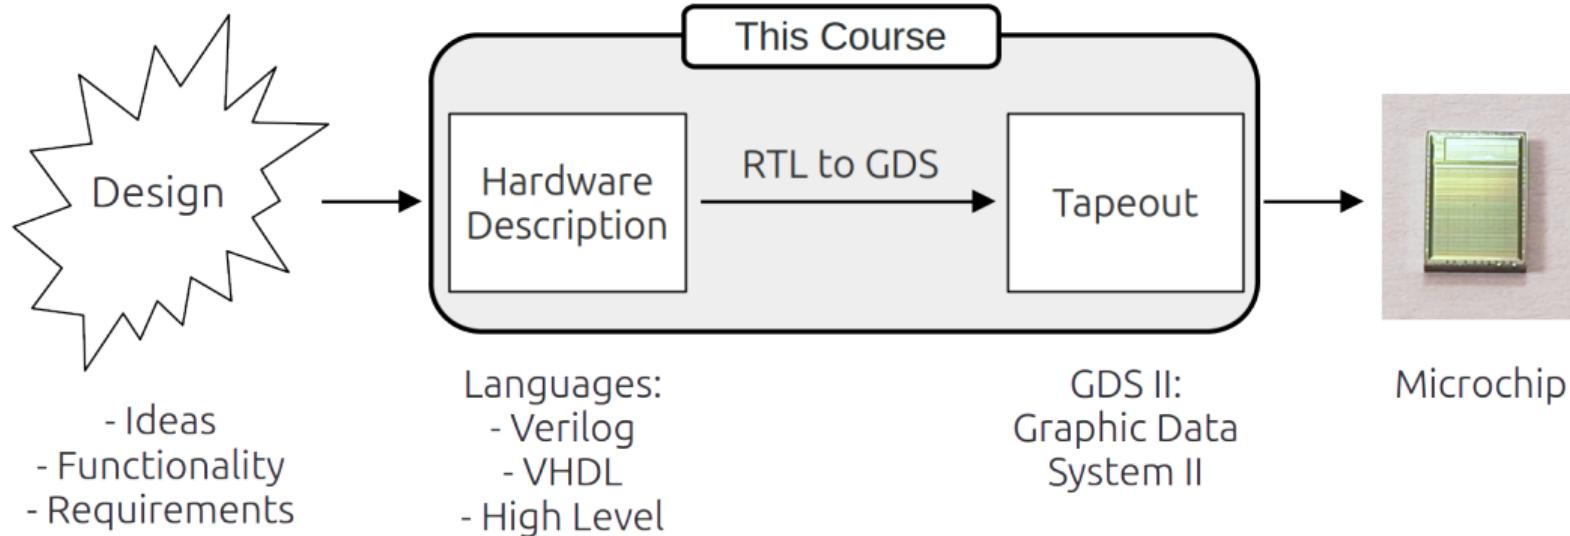

**From now on: This course means digital design, even if not mentioned everywhere again**

# From design to microchip

# RTL to GDS toolchain

# RTL: Register Transfer Level

In [digital circuit design](#), **register-transfer level (RTL)** is a design abstraction which models a [synchronous digital circuit](#) in terms of the flow of digital signals ([data](#)) between [hardware registers](#), and the [logical operations](#) performed on those signals.

Register-transfer-level abstraction is used in [hardware description languages](#) (HDLs) like [Verilog](#) and [VHDL](#) to create high-level representations of a circuit, from which lower-level representations and ultimately actual wiring can be derived. Design at the RTL level is typical practice in modern digital design.<sup>[1]</sup>

Unlike in software compiler design, where the register-transfer level is an intermediate representation and at the lowest level, the RTL level is the usual input that circuit designers operate on. In fact, in circuit synthesis, an intermediate language between the input register transfer level representation and the target [netlist](#) is sometimes used. Unlike in netlist, constructs such as cells, functions, and multi-bit registers are available.<sup>[2]</sup> Examples include FIRRTL and RTLIL.

[Transaction-level modeling](#) is a higher level of [electronic system design](#).

## RTL description [\[edit\]](#)

A synchronous circuit consists of two kinds of elements: registers (sequential logic) and [combinational logic](#). Registers (usually implemented as [D flip-flops](#)) synchronize the circuit's operation to the edges of the clock signal, and are the only elements in the circuit that have memory properties. Combinational logic performs all the logical functions in the circuit and it typically consists of [logic gates](#).

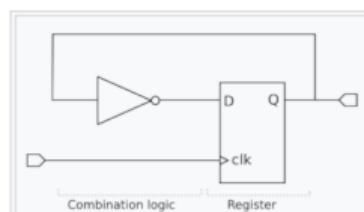

Figure 4: RTL (Screenshot from Wikipedia<sup>1</sup>)

<sup>1</sup>[https://en.wikipedia.org/wiki/Register-transfer\\_level](https://en.wikipedia.org/wiki/Register-transfer_level)

# GDS: Graphic Data System (II)

**GDSII**

Article Talk

From Wikipedia, the free encyclopedia

**GDSII stream format (GDSII)**, is a binary database file format which is the de facto industry standard for electronic design automation (EDA) data exchange of integrated circuit (IC) or IC layout artwork.<sup>[1]</sup> It is a binary file format representing planar geometric shapes, text labels, and other information about the layout in hierarchical form (two-dimensional/2D CAD file format). The data can be used to reconstruct all or part of the artwork to be used in sharing layouts, transferring artwork between different tools, or creating photomasks.

**History** [ edit ]

GDS = Graphic Design System (see [GDS78])

Initially, GDSII was designed as a stream format used to control integrated circuit photomask plotting. Despite its limited set of features and low data density, it became the industry conventional stream format for transfer of IC layout data between design tools of different vendors, all of which operated with proprietary data formats.

It was originally developed by Calma for its layout design system, "Graphic Design System" ("GDS") and "GDSII".

<b>GDSII</b>	
<b>Filename extension</b>	.gds
<b>Developed by</b>	Calma
<b>Initial release</b>	1989; 36 years ago
<b>Type of format</b>	binary <sup>[1]</sup>
<b>Free format?</b>	no

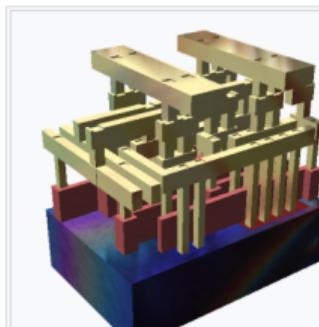

Figure 5: GDS (Screenshot from Wikipedia <sup>2</sup>)

<sup>2</sup><https://en.wikipedia.org/wiki/GDSII>

# The GDS II Format (Specifications)

Here are two links about the structure, format and elements of GDS II. The links are for reference reasons. It is not strictly necessary to read or learn the GDS II format for this course. But it might help understanding.

<https://boolean.klaasholwerda.nl/interface/bnf/gdsformat.html>

<https://www.rulabinsky.com/cavd/text/chapc.html>

# Naming of RTL-to-GDS tools:

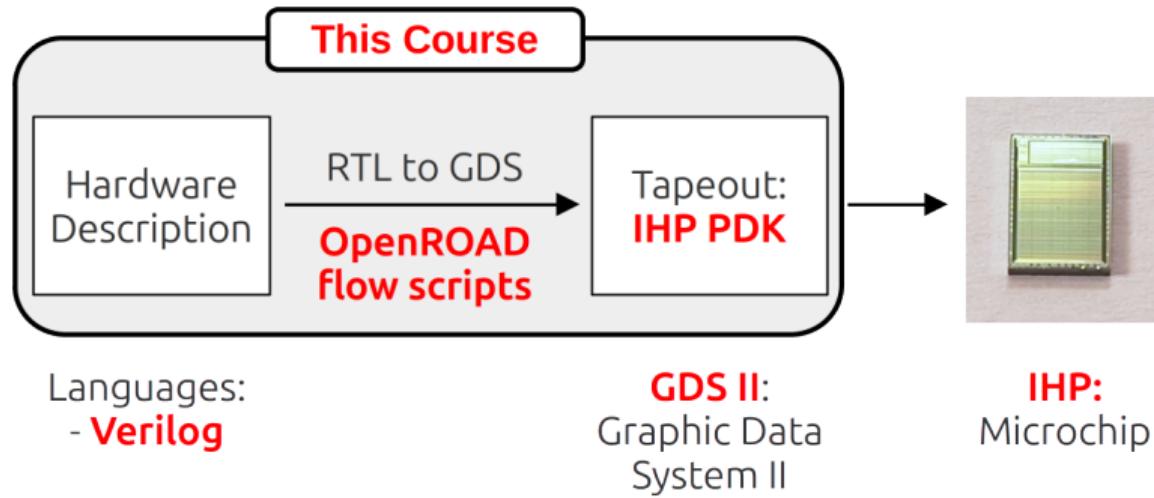

The naming of the tools is confusing:

- RTL-to-GDS
- = RTL-2-GDS
- = End-to-End-ASIC tools
- = End-to-End EDA toolchain

They all mean the same.

# In this course: ORFS - OpenROAD flow scripts

# Many open-Source RTL-to-GDS toolchains

Most known RTL-to-GDS toolchains:

- OpenLANE
- OpenLANE 2
- Silicon Compiler
- Coriolis

Used with IHP PDK and in this course:

- OpenROAD flow scripts

which is based on

- OpenROAD

# A toolchain based on scripts and configuration files

OpenROAD flow scripts are

- based on scripts (obvious in the name)
- based on configuration files

Want most developers know from the commercial tools is:

- Graphical GUIs, used with a mouse and keyboard (shortcuts).
- Configuration through graphical masks, windows, forms.

This might feel uncomfortable at the beginning. But it still has some advantages.

## Section 8

About open-source EDA

# Advantages of open-source in EDA

- A word by Andrew Kahng (head of OpenROAD) about the relevance of open-source EDA

Andrews slides from the keynote speech at the Chipdesign Network June 2024. As pptx:

<https://vlsicad.ucsd.edu/NEWS24/InnovationKeynote-v6-ACTUAL-DISTRIBUTED.pptx>

Andrews news page with the link (scroll to june 2024) <https://vlsicad.ucsd.edu/>

# Some aspects of open-source EDA

- Three well known PDKs are open-source and production-ready.
- Some other open-source PDKs are not that visible or prominent (MiniFab, Pragmatic(soon?), ...)
- More than one RTL-to-GDS toolchain is production tested.
- Academia starts teaching a lot with open-source EDA.
- Building microchips with open-source became easy and affordable.
- No NDAs, No licence costs, Start with a laptop and internet.

# What people have done with open-source EDA

- The following slides contain some works that were made with open-source EDA tools and open-source PDKs.
- Most of this would not have been possible in closed source (because of NDAs)
- Open-source EDA drives people to experiment and play with the technology.

# Questions

Chapter 1 -  
Introduction  
and overview -  
QUESTIONS

Course authors  
(Git file)

- What are the features of open-source software?
- RTL is an abbreviation for ... ?
- Explain RTL in your own words.
- GDS (II) is an abbreviation for ... ?
- Explaining GDS (II) in your own words.
- RTL-to-GDS (RTL2GDS) stands for? Name some bulletpoints.
- What is OpenROAD?
- How old is OpenROAD?
- Is there more OS-EDA software than OpenROAD?
- What are these? Name some?
- Since when can open-source EDA software be used to build physical microchips?

# Chapter 01 - Server, Login, Shell - TRAINING - Advenced

Course authors (Git file)

1

## Advanced shell training

# Advanced shell training

Learn some more usage of the linux terminal shell with this advanced training.

# Rename the textfile

You remember your textfile from earlier?

## Task: Rename the textfile

- Do this in a shell terminal (not in GNOME, means: no mouse, no file explorer!)
- Navigate to your created directory (with `cd` and `cd ..`)
- Rename your file to another filename with `mv`
- If you don't know how to use `mv`, read the man page first with `man mv` and learn the usage.

# Change the content in the textfile

## Task: Change the content in the textfile

- Do this in a shell terminal (not in GNOME, means: no mouse, no file explorer!)
- Navigate to your created directory (with `cd` and `cd ..`)
- Open the textfile with `nano <your filename>`
- Examine the two lines at the bottom. These are keyboard commands for the nano editor.  
Find the key shortcuts for save and exit. What are they?
- Change some text, save and exit your textfile.

# Chapter 01 - Server, Login, Shell - TRAINING - Bonus

Course authors (Git file)

- 1 Two ideas
- 2 Do the siliwiz lessons
- 3 Look for a tinytapeout design

# Two ideas

- For this Bonus training there are two ideas of what can be done.
- These tasks can be re-visited verytime during the course when there is free time. They might take longer then the course week itself.
- Taking these bonus ideas back to home as a starting point for your own EDA designs is intended.

# Do the siliwiz lessons

- Doing the siliwiz lessons helps a lot to learn more about semiconductors in general.
- In the course chapter about the open-source PDK the knowledge from Siliwiz will definitely be helpful for deeper understanding.
- If you want to go into analog circuit design, this might be a good start too.

## Task: Start doing the SiliWiz lessons

- Here you go (Link to lesson is upper left corner):
- <https://app.siliwiz.com/>
- Come back to the lessons whenever there is free time in the course.

# Look for a tinytapeout design

- In this course we have pre-configured and tested examples for the chip designs,
- But you could try to build an own designs. The course trainer might not be able to guide you fully. You're mostly on your own.

# What to expect

This idea is for:

- If you feel like you want to do an own design, but don't want to write a Verilog project from the start.
- Look into all the Tinytapeout shuttle runs. The designs are open-source.
- Open-source: You are allowed to review, modify, use the designs.
- So you can use them for creating your own example for this course.

# Where and how to start

## Task: Find a design from TinyTapeout

- <https://tinytapeout.com/runs/>
- Browse the designs from the TinyTapeout shuttle runs.
- Look a design that looks fitting for you
- Only take designs with good documentation!!!
- Find the Github repository of the design.
- Review the documentation and the Verilog code.

## Next steps (roughly)

After chapter 3 + 4 (Verilog and First run):

- Take a pre-configured example design (gcd) as template
- Copy the template as a new design (see ORFS tutorial)
- Add the Verilog from the TT design

After chapter 5 + 6 +7 (PDK and OpenROAD GUI):

- Try to modify the rest of the new design:
  - config files
  - constraints
  - Makefile
- Give it a try: run the design

# Chapter 01 - Server, Login, Shell - TRAINING - Common

Course authors (Git file)

- 1 Server and user credentials
- 2 GNOME desktop: First lookaround
- 3 The course data
- 4 Linux shell
- 5 IMPORTANT Tasks
- 6 Flow directory
- 7 Online shell resources

# Server and user credentials

The PC environment for the course will be provided by IHP.

- Your PC in front of you must be connected to a server
- You will then work in a Ubuntu 24 Linux system
- The desktop GUI will be Gnome

# Connect to the IHP server

Follow these steps:

- ① Open ThinLinc on the host PC (Windows?)
- ② Go to the Options and set “Fullscreen on this monitor”
- ③ Connect with the login data, given to you by IHP
- ④ Ubuntu with Gnome desktop should start in ThinLinc

For Log out:

- ① Just “Log out”. Don’t Power Off.
- ② This will take you back to the host system.

Notice:

- Please ask if there is questions!
- We’ll try to do this for all participants first, before proceeding to the next steps of the training.

# Search, start and close programs

Create and save a textfile:

- ① Search for a texteditor (gedit)
- ② Open gedit
- ③ Write a litte (your name or anything else)
- ④ Save the textfile with a name and the suffix .txt
- ⑤ To a new directory: Documents/myfiles
- ⑥ Close the texteditor (gedit)

# Tab-switching between programs

Tab-switch between opened programs:

- ① Search and open at least three different programs (office, gedit, document viewer?)
- ② Tab between the programs (with ALT+TAB on the keyboard)
- ③ It is a circle. After three Tabs you should be at the first again.
- ④ Close all programs

# Download and unpack

## Get the course data

- Get the latest release download package:

<https://github.com/OS-EDA/Course/releases>

- Create a directory for the course slides.
- In Linux the ~/Documents is a good place to create the directory. Maybe create the directory Documents/course
- Unpack the course into this directory.

# Look around in the course data

The screenshot shows a GitHub repository page for the "open-source EDA course". The repository has 161 commits and 1 tag. The main branch is "main". The repository is public and has an Apache-2.0 license. It has 27 stars and 9 watchers. There are 7 forks. The repository is reportable. It has 1 release and no packages published. The repository uses Shell and has 100% coverage.

Figure 1: Course directory structure

# The chapters and slides

You will find the slides in the build directory.

- If sorted alphabetical, it makes most sense.
- C0X is the chapter number.
- In each chapter:
  - Start with the lecture
  - Cheatsheet (if available) is a single slide
  - Trainings in the order common, advanced and bonus
  - Questions are for the next day (mornings)

## Task:

- Examine the build directory.
- Open and close some of the pdf files.
- Become comfortable with the course structure.

# Links from the slides

This might be outdated for the course, please try yourself.

- An issue with the linux document viewer and snap browsers.
- Links from slides don't open in the browser.

Possible workaround:

- Right click the link and copy
- Open browser
- Paste link to URL line

# Workspace arrangement

Suggestions or Options:

- Arrange windows next to each other
- ALT+TAB between programs (tasks)
- Close unwanted windows after the completion of a chapter

# Short command list of a linux shell

- ls (list content of directory)
- ls -al (list with option for more information)
- cd directoryname (change to directory)
- cd .. (change to upper directory)
- mkdir (make directory)
- touch (make file)
- mv (move)
- cp (copy)
- nano (opens the nano file editor)

# Man pages

If unsure how to use a command, read the man-page:

```
1 | man <command>
```

## Task:

- Open the man pages of all the commands in the above list (last slide)
- Find the syntax for the commands (it is given on the top of the man page)
- What are OPTION, SOURCE and DEST ?
- Find the definition of the option -al for the command ls

# IMPORTANT Tasks

To get ready for working with the open-source EDA tools, you must run (execute) a shell script in your shell terminal.

**This is absolutely necessary for the rest of the course**

There are two options to do this:

- ① Every time you open a shell and want to work with the tools
- ② Once in the bashrc

# Option 1: Source every time in the shell

## Task: Setup the linux tool environment

- Open a shell terminal
- Run source /eda/or2/env.sh
- Do this every time you open a new shell.
- It doesn't hurt if you do it multiple times. Nothing breaks.
- It will lead to strange behaviour and not results if it is not done.

You should get a message like copied flow directory or flow directory already there

## Option 2: Source in the bashrc

### Task: Madify .bashrc with source command

- Open the file .bashrc in a texteditor. (.bashrc is in your home directory)
- At the bottom line, add the command source /eda/or2/env.sh
- Save the file and close the editor
- In a shell terminal: reload bashrc with the command . ~/.bashrc

You should get a message like copied flow directory or flow directory already there

# Check the environment

- Check if the setup was successfull.
- **Don't continue if the following checks are errornous, but ask for help from the trainer**

## Task: Check the environment

- Open a shell terminal
- Run source /eda/or2/env.sh
- See if the tools are sourced (available) with getting their versions:
  - openroad –version should give you the version number
  - yosys --version should give you the version number
  - klayout -v should give you the version number

# Congratulations!

**Congratulations:**

**You have successfully run some of the open-source EDA tools on a linux server.**

- You did run openroad, yosys and klayout.
- They did not do much, but giving you their version numbers.
- But it is the needed base for the rest of the course.

**You are on a good way**

# Linux Power settings

By default the screen goes black after 5 minutes of idle. Additionally the screen locks and you have to enter your password again.

This is good and intended. But might be a little too annoying for the course.

## Task: Disable screen black out

- Find the linux “power settings”
- Disable the “screen black after 5 mins” or higher the value.

# Flow directory

The last step (the important one) created a directory in your linux home directory:

- The flow directory

This is the most important directory for the course!

# Examine the flow directory

## Task: Examine the flow directory

- Open a shell terminal
- Run source /eda/or2/env.sh
- Navigate to the flow directory as you learned before
- List the content with ls -al
- Find:
  - The Makefile
  - The /flow/designs/src directory. What is inside?
  - The flow/designs/ihp-sg13g2 directory. What is inside?

# The Makefile

## Task: Open the Makefile

- Open the Makefile in a texteditor (with gedit)
- What is inside the Makefile?
- What could be the meaning of
  - DESIGN\_CONFIG=....
  - #DESIGN\_CONFIG=====
- Close texteditor without changes in the Makefile

# Online shell tutorial

To learn some Linux shell, you should find a tutorial that matches good to you.

I found this one simple and good to follow for me while learning Linux shell:

<https://community.linuxmint.com/tutorial/view/100>

# Makefile

OpenROAD flow scripts use Makefiles. So you might want to learn some basics about Makefiles.  
Again here is the tutorial that has helped me most:

<https://makefiletutorial.com/>

# Tips and tricks

- shell: TAB for autocomplete
- shell: 2xTAB for all choices of autocomplete
- Open a new shell terminal with the mouse:
  - Right click on an empty space in the directory window
  - Choose “open in Terminal”

## Chapter 2 - OpenROAD workflow

## Section 1

History of OpenROAD

# Foundations and Realization of Open, Accessible Design (OpenROAD)

At the top of the documentation:

<https://openroad-flow-scripts.readthedocs.io>

The screenshot shows the homepage of the OpenROAD Flow Scripts documentation. The left sidebar contains a navigation menu with links to "User Guide", "Build Using Pre-built Binaries", "Build Using Docker", "Build Locally", "Build Using WSL", "Environment Variables for the OpenROAD Flow Scripts", "Metrics", and "AutoTuner". Above the sidebar, there is a social sharing section with icons for GitHub, Twitter, LinkedIn, and Stars (375). The main content area features a title "Welcome to the OpenROAD Flow Scripts documentation!" and a detailed description of the project's mission and scope. The description highlights the project's launch in June 2018 within the DARPA IDEA program, its aim to bring down barriers of cost, expertise, and unpredictability, and its development of a fully autonomous, open-source tool chain for digital SoC layout generation.

Welcome to the OpenROAD Flow Scripts documentation!

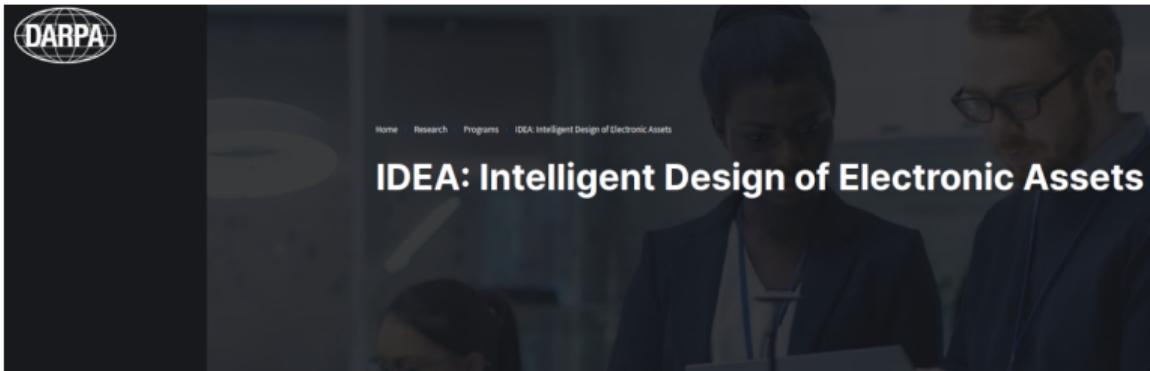

The OpenROAD ("Foundations and Realization of Open, Accessible Design") project was launched in June 2018 within the DARPA IDEA program. OpenROAD aims to bring down the barriers of cost, expertise and unpredictability that currently block designers access to hardware implementation in advanced technologies. The project team (Qualcomm, Arm and multiple universities and partners, led by UC San Diego) is developing a fully autonomous, open-source tool chain for digital SoC layout generation, focusing on the RTL-to-GDSII phase of system-on-chip design. Thus, OpenROAD holistically attacks the multiple facets of today's design cost crisis: engineering resources, design tool licenses, project schedule, and risk.

## Program Summary

Next-generation intelligent systems supporting Department of Defense (DoD) applications like artificial intelligence, autonomous vehicles, shared spectrum communication, electronic warfare, and radar require processing efficiency that is orders of magnitude beyond what is available through current commercial electronics. Reaching the performance levels required by these DoD

# OpenROAD V1.0

Document with OpenROAD V1.0 Expectations:

<https://vlsicad.ucsd.edu/NEWS19/OpenROAD%20RTL-to-GDS%20v1.0%20Expectations.pdf>

## OpenROAD v1.0 Expectations

Andrew B. Kahng and Tom Spyrou  
The OpenROAD Project

November 22, 2019

Web: <https://theopenroadproject.org/>  
GitHub: <https://github.com/The-OpenROAD-Project>

The OpenROAD v1.0 tool, to be released in July 2020, will be capable of push-button, DRC-clean RTL-to-GDS layout generation in a commercial FinFET process node. The tool is currently visible [here](#). In its v1.0 form, it will be integrated on an incremental substrate provided by [the OpenDB database](#) and [the OpenSTA static timing engine](#). It will also offer users and

Figure 4: OpenROAD v1.0<sup>4</sup>

# V1.0 Roadmap

How to deal with these expectations:

<https://eri-summit.darpa.mil/docs/ERIsummit2019/posh/08IDEA%20UCSD%20Website.pdf>

## Looking Forward (Year 2 = Phase 1B)

- V1.0 July 2020 must advance 20 years on EDA industry learning curve within next 2-3 quarters
  - 1980's file-based integration **July 2019**
  - 2000's tight integration on shared incremental substrate **July 2020**
- Next: architecture, database, build/CI/devops, CAE/PE,
  - + teaching EDA SW to the OpenROAD/FOSS community
- Professionals on the team: mandatory
  - Industry veterans who have "done this before"

Figure 5: Looking forward<sup>5</sup>

# Courses for OpenROAD

A single excellent project (some of us might know):

<https://theopenroadproject.org/Courses/>

The screenshot shows the OpenROAD website with a dark blue header bar. The header contains the OpenROAD logo on the left and navigation links for HOME, ABOUT US, NEWS, RESOURCES, BLOGS, COMMUNITY, USER STORIES, and CONTACT US on the right. Below the header, the word "Courses" is centered above a table. The table has two columns: "Title" and "File/Link". There is one row in the table with the title "ZeroToASIC by Matt Venn" and the link [https://zerotoasiccourse.com/matt\\_venn/](https://zerotoasiccourse.com/matt_venn/).

Title	File/Link

# Help with the terminology

Searching the terms with a standard search engine might not bring useful results every time.  
Matt Venn created a page for EDA terminology:

<https://www.zerotoasiccourse.com/terminology/>

The screenshot shows the homepage of the website. At the top right, there is a navigation bar with links: Articles, About Matt Venn, Interviews, Newsletter, Resources, Terminology (which is highlighted in blue), and Videos. Below the navigation bar, there is a large, dark banner with a space-themed image of a planet and a satellite dish logo. The word "Terminology" is prominently displayed in white text on the right side of the banner. The main content area has a white background. In the center, there is a small text block that reads: "I've collected all the ASIC jargon here and broken it down into easy to understand descriptions." Below this text, there are several categories listed in a grid format. The categories are: Antenna Report, ASIC, CMOS; Corner, Die, Doping; DRC, Floorplan, Foundry; FPGA, GDSII, Harden. Each category has a small, light-colored rectangular box next to its name.

# Resources list

Awesome open-source ASIC resources:

<https://github.com/mattvenn/awesome-opensource-asic-resources>

Zero-to-ASIC resources list:

<https://www.zerotoasiccourse.com/resources/>

AIC 2025 lectures by Carsten Wullf:

Recap questions for Chapter 2

# Questions

Chapter 2 -  
OpenROAD  
workflow -  
QUESTIONS

Course authors  
(Git file)

- Name some of the internet resources linked in chapter 2.
- Where are the origins of OpenROAD?
- Is OpenROAD a fully from-the-scratch written toolchain?
- Can you name some of the included (used) software projects?
- How many contributors has
  - OpenROAD (OR)?
  - OpenROAD flow scripts (ORFS)?
- How many close (open) issues (pull requests) has ORFS?
- Name the flow steps in ORFS (round robin in the room)
- Name the flow components in ORFS (round robin in the room)
  - (Bonus) Can you describe what the component does?

## Chapter 02 - Terminology - TRAINING - Advanced

Course authors (Git file)

1

## Preparation for chapter 03 + 04 Bonus Training

Another option for building your own design can be started.

#### Task: Learn about LFSR

- Read the Wikipedia about Linear Feedback Shift Registers.
- [https://en.wikipedia.org/wiki/Linear-feedback\\_shift\\_register](https://en.wikipedia.org/wiki/Linear-feedback_shift_register)

#### Task: Design your own LSFR

- Try drawing a small LSFR
- 4 to 8 bits length maximum
- 1 or 2 feedback lines with XOR

#### Task: Simulate the LSFR with a Bit table

- Simulate your LSFR with a Bit table
- How should the table look?
- Clock, Register content, Feedback Bits, Input, Output

## Chapter 02 - Terminology - TRAINING - Common

Course authors (Git file)

1

## Searching

# Browse the resources

## Task: Review the flow terminology

- Try to formulate the meaning and purpose of all the following search results in your own words.
- Search for each of the flow steps
  - Synthesis
  - Floorplan
  - Placement
  - Clock Tree Synthesis
  - Routing
  - Finishing
- Search for as much flow components as possible (see the components names in the diagram in the lecture slides)
- If no result is found, try a search engine (or chatGPT).

Matt Venns list:

<https://www.zerotoasiccourse.com/terminology/>

# Getting the words in place

In the beginning it can be hard to learn all the new words and give them meaningful connections immediately.

Let's try to create a timeline (or taskline) for "How to make microchips?" in a joint effort.

## Task: Create a diagram "How to make a microchip?"

- Everyone can give a keyword of the topic "How to make a microchip?"
- We try to figure out the meaning and the position in a timeline / taskline?
- Flipchart, Whiteboard, Texteditor?

# List the open-source tools in OpenROAD

OpenROAD uses a lot of open-source tools, that were available even before OpenROAD.

## Task: Create a list of tools

- Use this link list as the knowledge base:
  - <https://openroad-flow-scripts.readthedocs.io/en/latest/tutorials/FlowTutorial.html#running-the-automated-rtl-to-gds-flow>
- Find the names of the open-source tools that are used in ORFS.
- Create a list with the columns:
  - Name of the open-source tool
  - Flow step and flow component in ORFS where the tool is used.
  - Description of the function of the tool
  - Bonus: What was modified or contributed to this tool by the OpenROAD team?

# Example row

Example row in the list:

- Yosys
- Synthesis
- Verilog and constraints to netlists
- Most of the initial development was coded by Claire Wolf (not by ORFS)

# Chapter 3 - Verilog crash course

Course authors (Git file)

- 1 Introduction
- 2 Verilog elements
- 3 Simple circuits: Combinational
- 4 Simple circuits: Sequential
- 5 Selected feature: Parameterized counter
- 6 Selected feature: Preprocessor
- 7 Selected feature: Yosys and Systemverilog

# Section 1

## Introduction

# Introduction

Verilog was initially developed as a simulation language in 1983/1984, bought up by Cadence and freely released in 1990.

The first standardization took place in 1995 by the IEEE (Verilog 95). A newer version is IEEE Standard 1364-2001 (Verilog 2001).

- Syntax comparable to C (VHDL was started on ADA / Pascal) with compact code
- Spread in North America and Japan (less in Europe)
- Can also be used as the language for netlists
- Support from open source tools
- The majority of the ASICs are developed in Verilog.
- Less expressive than VHDL (curse and blessing)

The proximity to C and Java may lead to confusion. In Verilog, too, lines that describe a combinatorial circuit can also be replaced.

**\*\* Verilog is a hardware description language (HDL)\*\***

This crash course is limited to a subset of synthesizable language constructs in Verilog.

The aim of this selection is not commercial tools, but open-source development tools such as OpenRoad<sup>1</sup> or Toolchains for FPGAs, i.e. we also use some language constructs from Systemverilog, which are supported by the Yosys synthesis tool.

---

<sup>1</sup><https://theopenroadproject.org/>

## Literature

- Donald E. Thomas, Philip R. Moorby, *The Verilog Hardware Description Language*, Kluwer Academic Publishers, 2002, ISBN 978-1475775891
- Blaine Readler, *Verilog by example*, Full Arc Press, 2011, ISBN 978-0983497301

# Contributions, mentions and license

- This course is a translated, modified and ‘markdownized’ version of a Verilog crash course from Steffen Reith, original in german language.

<https://github.com/SteffenReith>

- The initial rework (translate, modify and markdownize) was done by:

<https://github.com/ThorKn>

- The build of the PDF slides is done with pandoc:

<https://pandoc.org/>

- Pandoc is wrapped within this project:

<https://github.com/alexeygumirov/pandoc-beamer-how-to>

- License:

GPLv3

# Synthesis tool: Yosys

One should also deal with the peculiarities of the synthesis tool. The well-known open source synthesis tool Yosys writes about this

Yosys is a framework for Verilog RTL synthesis. It currently has extensive Verilog-2005 support and provides a basic set of synthesis algorithms for various application domains. Selected features and typical applications:

- Process almost any synthesizable Verilog-2005 design
- Converting Verilog to BLIF / EDIF / BTOR / SMT-LIB / simple RTL Verilog / etc.
- ...

## Section 2

Verilog elements

# Structure of a verilog module

```
1  module module_name (port_list);
2  // Definition of the interface
3  Port declaration
4  Parameter declaration
5
6  // Description of the circuit
7  Variables declaration
8  Assignments
9  Module instantiations
10
11 always-blocks
12
13 endmodule
```

Port list and port declaration can be brought together in modern verilog.

// introduces a comment.

# Example: A linear feedback shiftregister

```

1 module LFSR (
2   input wire load,
3   input wire loadIt,
4   input wire enable,
5   output wire newBit,
6   input wire clk,
7   input wire reset);
8
9   wire      [17:0]  fsRegN;
10  reg       [17:0]  fsReg;
11  wire      taps_0, taps_1;
12  reg       genBit;
13
14
15  assign taps_0 = fsReg[0];
16  assign taps_1 = fsReg[11];
17
18  always @(*) begin
19    genBit = (taps_0 ^ taps_1);
20    if(loadIt) begin
21      genBit = load;
22    end
23  end

```

```

1   assign newBit = fsReg[0];
2   assign fsRegN = {genBit,fsReg[17 : 1]};
3
4   always @ (posedge clk) begin
5     if(reset) begin
6       fsReg <= 18'h0;
7     end else begin
8       if(enable) begin
9         fsReg <= fsRegN;
10      end
11    end
12  end
13
14 endmodule

```

**input** and **output** define the directions of the ports.

# Constants and Operators

There are four values available for constants and signals:

- 0 / 1
- X or x (unknown)
- Z or Z (high impedance)

One can specify the width of constants:

- Hexadecimal constant with 32 bit: 32'hDEADBEEF
- Binary constant with 4 bit: 4'b1011
- For better readability you can also use underscores: 12'B1010\_1111\_0001

To specify the number base use

- b (binary)
- h (hexadecimal),
- o (octal)
- d (decimal)

The default is decimal (d) and the bit width is optional, i.e. 4711 is a valid (decimal) constant.

There is an array notation:

- wire [7:0] serDat;
- reg [0:32] shiftReg;
- Arrays can be sliced to Bits:
  - serDat[3 : 0] (low-nibble)
  - serDat[7] (MSB).
- {serDat[7:6], serDat[1:0]} notes the concatenation.
- Bits can be replicated and converted into an array, i.e  $\{8\{\text{serData}[7 : 4]\}\}$  contains eight copies of the high-nibble from serDat and has a width of 32.

Arithmetic operations, relations, equivalences and negation:

- $a + b$ ,  $a - b$ ,  $a * b$ ,  $a / b$  und  $a \% b$
- $a > b$ ,  $a \leq b$ , und  $a \geq b$
- $a == b$  und  $a != b$ ,
- $!(a = b)$

\*\* Attention: \*\* If x or z do occur, the simulator determines false in a comparison. If you want to avoid this, the operators === and !== exist. So the following applies:

```
1 if (4'b110z === 4'b110z)  
2 // not taken  
3 then_statement;
```

```
1 if (4'b110z == 4'b110z)  
2 // not taken  
3 then_statement;
```

Boolean operations exist as usual:

**bitwise operators:** & (AND), | (OR), ~ (NOT), ^ (XOR) und auch ~^ (XNOR)

**logic operators:** && (AND), || (OR) und ! (NOT)

**Shiftoperations:** a « b (shift a for b positions to the left) und a » b (shift a for b positions to the right). A negative number b is not permitted, empty spots are filled with 0.

# Parameters (old style)

In order to be able to adapt designs easier, Verilog offers the use of parameters.

```
1 module mux (
2     in1 , in2 ,
3     sel ,
4     out);
5
6     parameter WIDTH = 8; // Number of bits
7
8     input [WIDTH - 1 : 0] in1 , in2 ;
9     input sel;
10    output [WIDTH - 1 : 0] out;
11
12    assign out = sel ? in1 : in2;
13
14 endmodule
```

# Instances and structural descriptions

If you describe a circuit through its (internal) structure or if a partial circuit is to be reused, an instance is generated and wired.

```
1 module xor2 (
2   input wire a,
3   input wire b,
4   output wire e);
5   assign e = a ^ b;
6 endmodule
```

```
1 module xor3 (
2   input wire a,
3   input wire b,
4   input wire c,
5   output wire e);
6
7   wire tmp;
8   xor2 xor2_1 // Instance 1
9   (
10     .a(a),
11     .b(b),
12     .e(tmp)
13   );
14   xor2 xor2_2 // Instance 2
15   (
16     .a(c),
17     .b(tmp),
18     .e(e)
19   );
20
21 endmodule
```

# Code for sequential circuits

A flip-flop takes over the input of the rising or falling edges of the clock. For this, the block entry is used with the *@-symbol* and *always* blocks:

```
1 module FF (input  clk ,
2             input  rst ,
3             input  d,
4             output q);
5
6   reg q;
7
8   always @ ( posedge clk or
9             posedge reset)
10  begin
11    if ( rst )
12      q <= 1'b0;
13    else
14      q <= d;
15  end
endmodule
```

The list of signals after the *@-symbol* means sensitivity list. The reset is synchronized when you remove or *posedge reset*.

## Section 3

Simple circuits: Combinational

Combinational circuits correspond to pure boolean functions and therefore do not contain the key word *reg*. No memory (flip-flops) gets generated and assignments are done with *assign*.

```
1 module mux4to1 (in1, in2, in3, in4, sel, out);
2
3 parameter WIDTH = 8;
4
5 input [WIDTH - 1 : 0] in1, in2, in3, in4;
6 input [1:0] sel;
7 output [WIDTH - 1 : 0] out;
8
9 assign out = (sel == 2'b00) ? in1 :
10      (sel == 2'b01) ? in2 :
11      (sel == 2'b10) ? in3 :
12      in4;
13 endmodule
```

# Priority encoder

Similarly to the VHDL version, we describe the priority encoder as follows:

```
1 module prienc (input wire [4 : 1] req,
2                 output wire [2 : 0] idx);
3
4     assign idx = (req[4] == 1'b1) ? 3'b100 :
5                 (req[3] == 1'b1) ? 3'b011 :
6                 (req[2] == 1'b1) ? 3'b010 :
7                 (req[1] == 1'b1) ? 3'b001 :
8                 3'b000;
9
10    endmodule
```

# Priority encoder (alternative version)

For a priority encoder you can use the *don't care* feature from Verilog.

```
1 module prienc (input [4:1] req,
2                 output reg [2:0] idx);
3
4     always @(*) begin
5         casez (req) // casez allows don't-care
6             4'b1????: idx = 3'b100; // Also: idx = 4;
7             4'b01???: idx = 3'b011;
8             4'b001?: idx = 3'b010;
9             4'b0001: idx = 3'b001;
10            default: idx = 3'b000;
11        endcase
12    end
13
14 endmodule
```

## Section 4

Simple circuits: Sequential

# Synchronous design

Contrary to combinational circuits, sequential circuits use internal memory, i.e. the output not only depends on the input.

In the synchronous method, all memory elements are checked / synchronized by a global clock. All calculations are carried out on the rising (and/or) falling edge of the clock.

The synchronous design enables the draft, test and the synthesis of large circuits with market tools. For this reason, it is advisable to remember this design principle.

Furthermore, there should be no (combinational) logic in the clock path, as this can lead to problems with the distribution times of the clock signals.

# Synchronous circuits

The structure of synchronous circuits is idealized as follows:

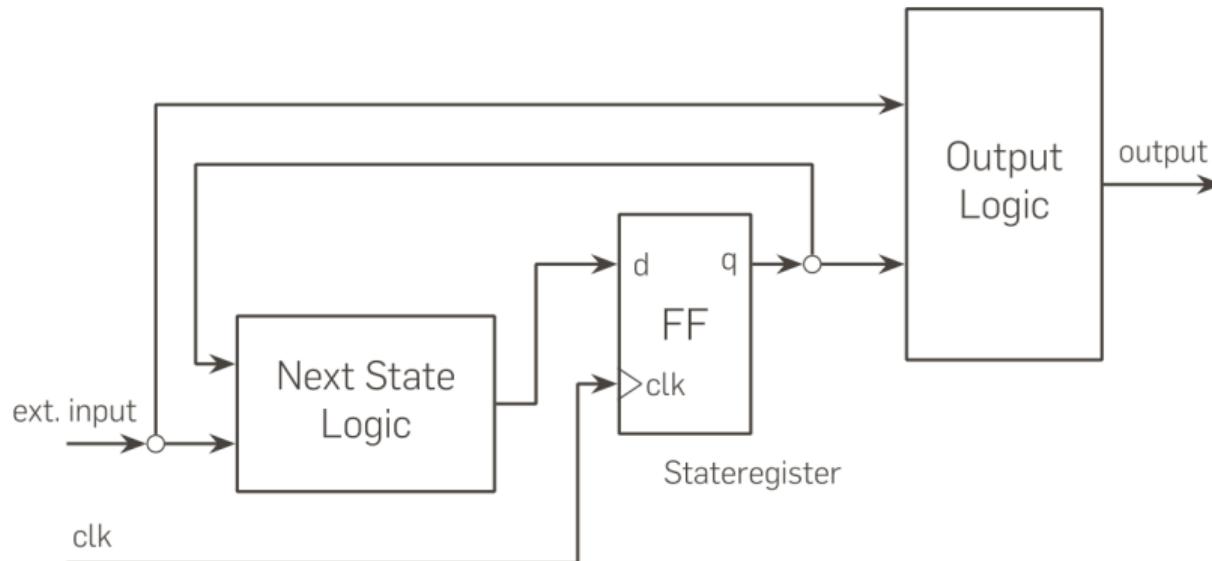

Figure 1: Idealized diagram of a synchronous circuit

# A binary counter

According to the synchronous design, a free running binary counter can be realized:

```
1 module freecnt (value , clk , reset);
2
3     parameter WIDTH = 8;
4
5     input  wire  clk;
6     input  wire  reset;
7     output wire [WIDTH - 1 : 0] value;
8
9     wire [WIDTH - 1 : 0] valN;
10    reg   [WIDTH - 1 : 0] val;
11
12    always @ (posedge clk) begin
13
14        if (reset) begin // Synchron reset
15            val <= {WIDTH{1'b0}};
16        end else begin
17            val <= valN;
18        end
19
20    end
21
22    assign valN = val + 1; // Nextstate logic
23    assign value = val; // Output logic
24 endmodule
```

# Synthesis result of the binary counter

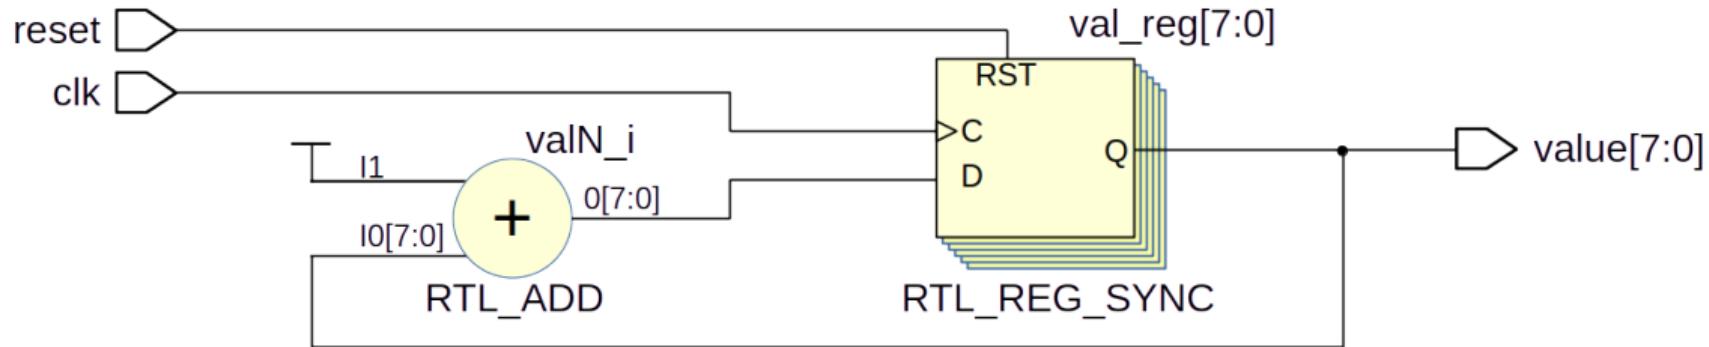

Figure 2: Synthesis diagram of the binary counter

At this point you can see that the result follows the diagram of the synchronous design.

*RTL\_REG\_SYNC* corresponds to the stateregister and *RTL\_ADD* corresponds to the next state logic.

# Some remarks

So far we use three assignment operators:

- assign signal0 = value
- signal2 <= value
- signal1 = value

The *assign* instruction is known as the continuous assignment and corresponds (roughly) to an ever active wire connection. It is used for signals of the type *wire* and is not permitted for *reg* (register).

The operator *<=* means non-blocking assignment. This assignment is used for synthesized registers, i.e. in *always-blocks* with *posedge clk* in the sensitivity list.

The variant *=* is called blocking assignment and is used for combinational *always-blocks*. Attention: Not allowed for signals of the type *wire*. So use the type *reg*.

# A modulo counter

According to the synchronous design, a freely running modulo counter can be realized:

```

1 module modcnt (value , clk , reset , sync);
2
3   parameter WIDTH  = 10,
4           MODULO = 800,
5           hsMin  = 656,
6           hsMax  = 751;
7
8   input  wire  clk;
9   input  wire  reset;
10  output wire [WIDTH - 1 : 0] value;
11  output wire sync;
12
13  wire [WIDTH - 1 : 0] valN;
14  reg   [WIDTH - 1 : 0] val;
```

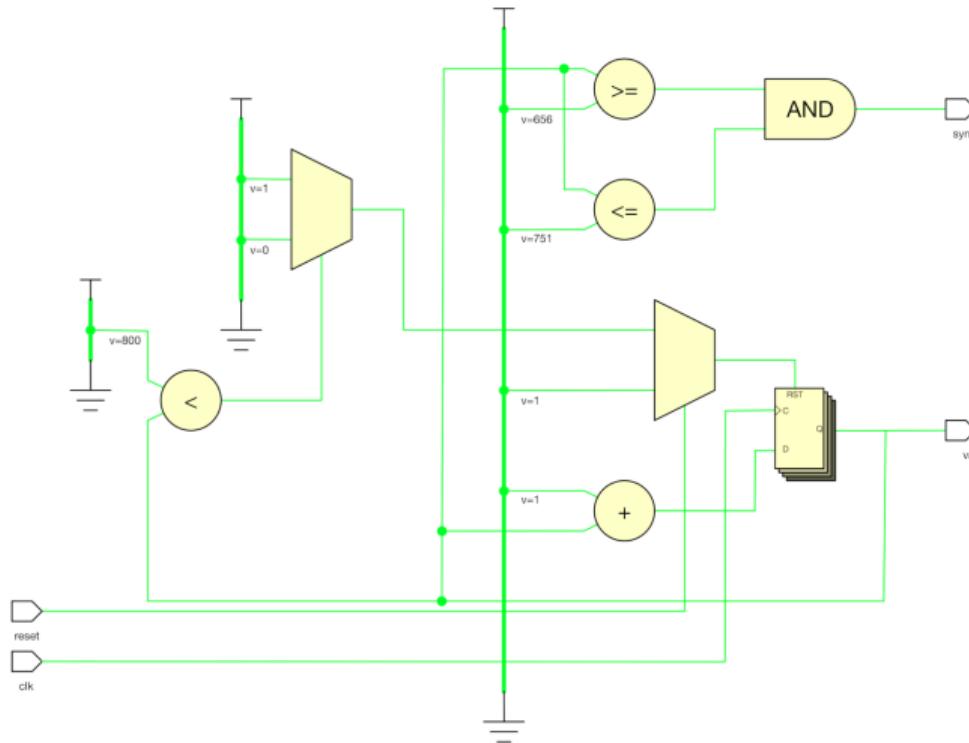

```

1   always @ (posedge clk) begin
2
3     if (reset) begin // Synchron reset
4       val <= {WIDTH{1'b0}};
5     end else begin
6       val <= valN;
7     end
8
9   end
10
11  // Nextstate logic
12  assign valN = (val < MODULO) ? val + 1 : 0;
13
14  // Output logic
15  assign value = val;
16  assign sync = ((val >= hsMin) && (val <= hsMax)) ? 1 : 0;
17
18 endmodule
```

# Synthesis result of the modulo counter

In this case, next state logic and output logic are of course more complex:

# A register file

RISC-V processors have a register file with a special zero register. Reading always provides 0 and writing operations are ignored.

```
1 module regfile (input clk,
2                  input [4:0] writeAddr, input [31 : 0] dataIn,
3                  input wrEn,
4                  input [4:0] readAddrA, output reg [31:0] dataOutA,
5                  input [4:0] readAddrB, output reg [31:0] dataOutB);
6
7 reg [31 : 0] memory [1 : 31];
8
9 always @ (posedge clk) begin
10
11   if ((wrEn) && (writeAddr != 0)) begin
12
13     memory[writeAddr] <= dataIn;
14
15   end
16
17   dataOutA <= (readAddrA == 0) ? 0 : memory[readAddrA];
18   dataOutB <= (readAddrB == 0) ? 0 : memory[readAddrB];
19
20 end
21
22 endmodule
```

## Section 5

Selected feature: Parameterized counter

# Selected feature: Parameterized counter

The newer variants of Verilog offer an improved version of the parameter feature:

```

1 module cnt
2 #(parameter N = 8,
3   parameter DOWN = 0)
4
5   (input clk,
6    input resetN,
7    input enable,
8    output reg [N-1:0] out);
9
10  always @ (posedge clk) begin
11
12    if (!resetN) begin // Synchron
13      out <= 0;
14    end else begin
15      if (enable)
16        if (DOWN)
17          out <= out - 1;
18      else
19        out <= out + 1;
20    end
21
22  end
23
24 endmodule
25
26

```

```

1 module doubleSum
2 #(parameter N = 8)
3   (input clk,
4    input resetN,
5    input enable,
6    output [N : 0] sum);
7
8   wire [N - 1 : 0] val0;
9   wire [N - 1 : 0] val1;
10
11 // Counter 0
12 cnt #(.N(N), .DOWN(0)) c0 (.clk(clk),
13 .resetN(resetN),
14 .enable(enable),
15 .out(val0));
16
17 // Counter 1
18 cnt #(.N(N), .DOWN(1)) c1 (.clk(clk),
19 .resetN(resetN),
20 .enable(enable),
21 .out(val1));
22
23 assign sum = val0 + val1;
24
25 endmodule

```

# Synthesis result of the parameterized counter

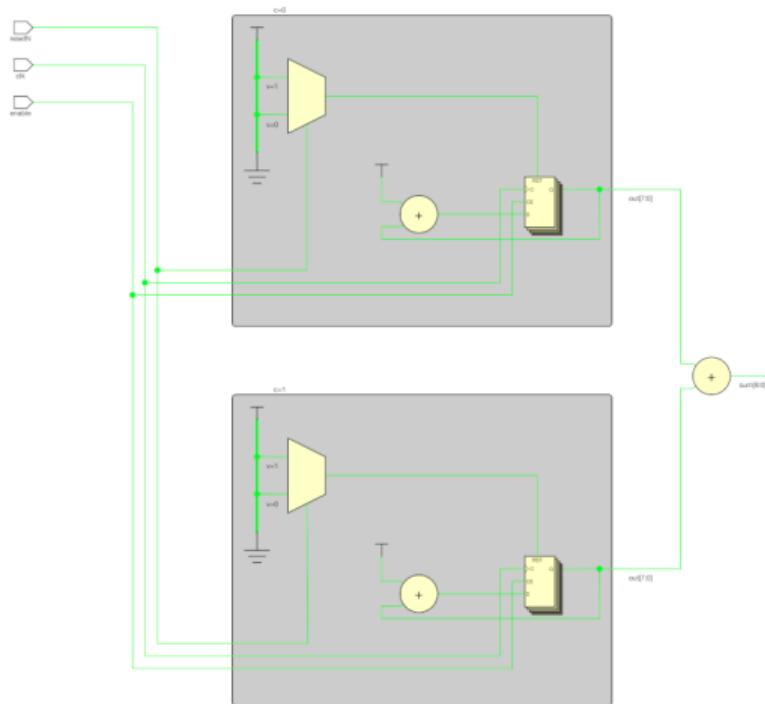

Figure 4: Parameterized counter

# An alternative version

Verilog still offers a (older) possibility for the parameterization of a design:

```
1 module double
2   #(parameter N = 8)
3   (input clk,
4    input resetN,
5    input enable,
6    output [N : 0] sum);
7
8   wire [N - 1 : 0] val0;
9   wire [N - 1 : 0] val1;
10
11 // Counter 0
12 defparam c0.N = N;
13 defparam c0.DOWN = 0;
14 cnt c0 (.clk(clk),
15          .resetN(resetN),
16          .enable(enable),
17          .out(val0));
```

```
1 // Counter 1
2 defparam c1.N = N;
3 defparam c1.DOWN = 1;
4 cnt c1 (.clk(clk),
5          .resetN(resetN),
6          .enable(enable),
7          .out(val1));
8
9 assign sum = val0 + val1;
10
11 endmodule
```

This variant leads to the same synthesis result.

## Section 6

Selected feature: Preprocessor

# Selected feature: Preprocessor

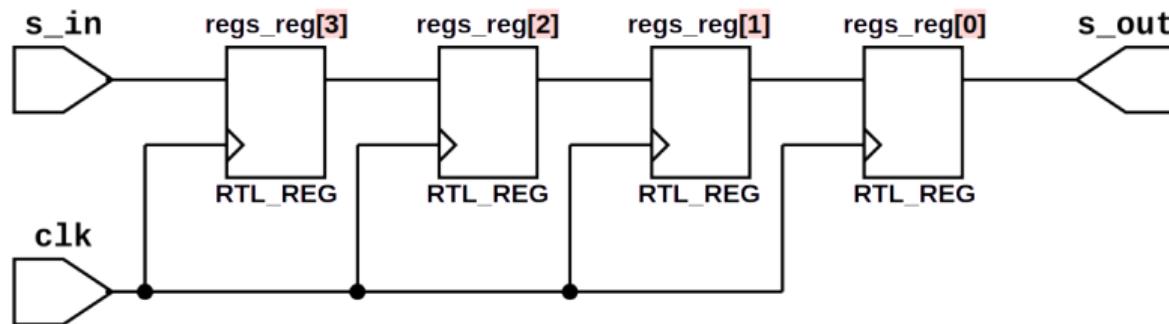

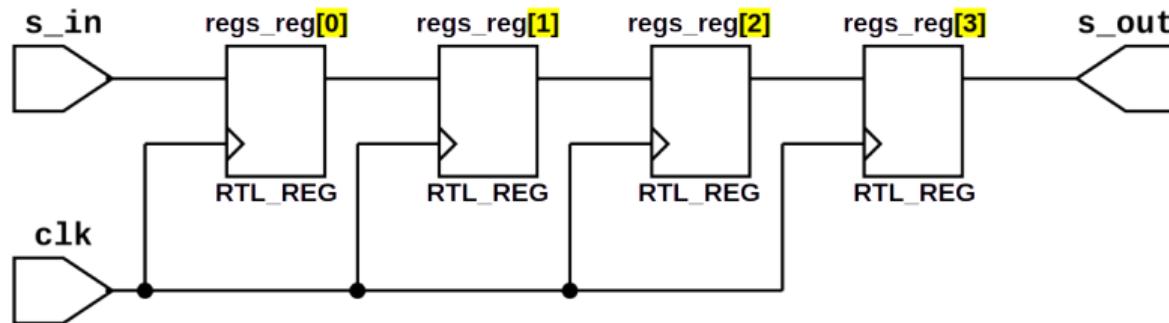

Verilog knows a preprocessor (cf. C/C++) with ‘define’, ‘include’ and ‘ifdef’. A *parameter* defines a constant and ‘define’ a text substitution.

```
1  `define SHIFT_RIGHT
2  module defineDemo (input clk, s_in,
3                      output s_out);
4
5    reg [3:0] regs;
6
7    always @ (posedge clk) begin // next state logic in always-block
8      `ifdef SHIFT_RIGHT
9        regs <= {s_in, regs[3:1]};
10       `else
11         regs <= {regs[2:0], s_in};
12       `endif
13   end
14
15  `ifdef SHIFT_RIGHT
16    assign s_out = regs[0];
17  `else
18    assign s_out = regs[3];
19  `endif
20
21 endmodule
```

# Two results of the synthesis

The conditional synthesis gives you two different shift registers:

# Modularisation

Comparable to the include mechanism of C/C++, Verilog offers the possibility of primitive modularization with ‘include’.

The tick symbol ‘ is again the marker for a preprocessor command, comparable to # at C/C++.

With ‘include headers\_def.h, for example, configuration settings from the file headers\_def.h can be included. Since a pure text replacement is carried out, the file extension is basically arbitrary. It is meaningful to use .h analogous to C.

If a ‘define is arranged in front of a ‘include, the text replacement is also carried out in the included header file, i.e. a ‘define applies globally from the definition on. However, this can happen comparable to C unintentionally.

## Section 7

Selected feature: Yosys and Systemverilog

# Selected feature: Yosys and Systemverilog

The open source synthesetool Yosys provides some selected extensions from SystemVerilog.

- The logic datatype is particularly interesting, which simplifies allocations with *reg* and *wire*. With *logic signed* you declare signed numbers.
- The special block *always\_ff* was introduced for sequential logic. Only non-blocking assignments ( $\leftarrow$ ) are used for assignments.
- For combinatorial logic, *always\_comb* replaces the construct *always @()*. Only blocking assignments ( $=$ ) are used in *always\_comb* blocks.

# Another counter

Now the free running counter is to be re-implemented:

```
1 module freecnt2
2
3 #(parameter WIDTH = 8)
4   (input logic clk,
5    input logic reset,
6    output logic [WIDTH - 1 : 0] value);
7
8   logic [WIDTH - 1 : 0] valN;
9   logic [WIDTH - 1 : 0] val;
10
11  always_ff @(posedge clk) begin
12
13    if (reset) begin // Synchron reset
14      val <= {WIDTH{1'b0}};
15    end else begin
16      val <= valN;
17    end
18
19  end
20
21  always_comb begin
22
23    valN = val + 1; // Nextstate logic
24    value = val; // Output logic
25
26  end
27
endmodule
```

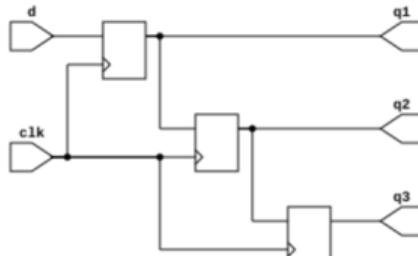

# Blocking and Non-blocking assignments in always\_ff

Caution with false assignments in *always\_ff*:

```

1 module demoOk (input clk,
2   input d,
3   output q1,
4   output q2,
5   output q3);
6   always_ff @(posedge clk) begin
7     q1 <= d;
8     q2 <= q1;
9     q3 <= q2;
10    end
11 endmodule

```

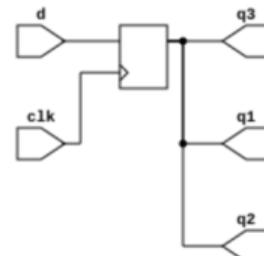

Okay:

```

1 module demoWrong (input clk,
2   input d,
3   output q1,
4   output q2,
5   output q3);
6   always_ff @(posedge clk) begin
7     q1 = d;
8     q2 = q1;
9     q3 = q2;
10    end
11 endmodule

```

Wrong:

## Recap questions for Chapter 3

# Questions

Chapter 3 -  
Verilog crash  
course -  
QUESTIONS

Course authors  
(Git file)

- What are HDL?
- What is Verilog?
- Are there other HDL?
- What is the main difference between HDL and programming languages?
- List and describe the structure of a simple Verilog file.
- Yosys is ... ?
- How to define ports in Verilog?
- Describe the concept of module instantiation in Verilog.
- What is the difference between combinational and sequential circuits?
- Try to explain the synthesized schematic of the parameterized counter in your own words.
- WHat is the problem with the assignements on the right side of the last slide?

# Chapter 3 - Verilog - TRAINING - Advanced

Course authors (Git file)

# 1 LFSR - Linear Feedback Shift Register

# LFSR - Linear Feedback Shift Register

This Training makes use of the Verilog code of the Linear Feedback Shift Register (LFSR) from the lecture slides.

# LFSR as example

## Task: Create directory and Verilog file

- Create a new directory for the LFSR example (in your Documents dir?)
- Create a new file `lfsr.v` inside that directory
- Copy the Verilog code from the lecture slides into the file `lfsr.v`

# Analyse parts of the Verilog source

Task: Identify parts in the code

Find combinational and synchronous parts of the LFSR in

- the Verilog code
- the Schematic drawing (from the lecture slides)

# Using yosys

## Task: Learn to use yosys basics

Start using the tool `yosys`. You can get a basic help list with `yosys --help`. And for the commands it is

```
yosys --help <command>
```

- Learn how to synthesize a Verilog file to a JSON netlist.
- Learn to save the JSON netlist to a file

**Tip:** Use ChatGPT or a search engine to get information about how to use yosys.

## Task: Netlist

Generate

- JSON Netlist

from the LFSR Verilog code

- Open the JSON netlist. Can you read it?

## Chapter 3 - Verilog - TRAINING - Common

Course authors (Git file)

1

## ORFS examples

# ORFS examples

The Trainings for chapter 3 (Verilog) start with two of the given examples inside ORFS:

- The gcd (greatest common denominator) example
- The ibex (RISC-V) example

For this Training no Verilog code must be written. The Tasks are only about reading and understanding the existing Verilog code.

# GDC example

## Task: Find the gcd example

- Find the Verilog file of the gcd example in ORSF
- Open the Verilog file with an editor

## Task: Questions about the code

- What are the port definitions
- How many inputs and outputs will the chip have?
- Can you identify other parts of the code?
- What would be the list of pins of a microchip with this design?

# IBEX example

## Task: Find the ibex example

- Find the top level Verilog file of the ibex example in ORSF
- Open the top level Verilog file with an editor

## Task: Questions about the code

- What are the port definitions?
- How many inputs and outputs has the top level module?
- Can you identify other parts of the code?
- What would be the list of pins of a microchip with this design?

## Chapter 04 - OpenROAD first run

Course authors (Git file)

1 Doing this chapter

2 The Makefile

3 The designs to run

## Section 1

Doing this chapter

# Doing this chapter

- This chapter is mostly a training.
- We will try to get our first results (GDS files).
- There are example designs available.
- You can start your own design.

## Section 2

### The Makefile

# The Makefile

Let's have a look into the Makefile first.

# The flow steps

The Makfile (in the `/flow` directory) contains all the flow steps in the same order we already have seen:

```
1 # =====
2 #
3 # <-----SYNTHESIS----->
4 #
5 # =====
6 # <-----FLOORPLAN----->
7 #
8 # <-----PLACE----->
9 #
10 # <-----ROUTING----->
11 #
12 # <-----FORESEE----->
13 #
14 .PHONY: sv
15 .PHONY: 34#
16 .PHONY: 35#
17 .PHONY: 36#
18 .PHONY: 37#
19 .PHONY: 38#
20 .PHONY: 39#
21 .PHONY: 40#
22 .PHONY: route
```

Figure 1: The flow steps in the Makefile

# DESIGN\_CONFIG

The Makefile starts with the selection of the design to run.

Of interest for this course are the lines regarding to the IHP PDK:

```
1 #DESIGN_CONFIG=./designs/ihp-sg13g2/aes/config.mk
2 #DESIGN_CONFIG=./designs/ihp-sg13g2/ibex/config.mk
3 DESIGN_CONFIG=./designs/ihp-sg13g2/gcd/config.mk
4 #DESIGN_CONFIG=./designs/ihp-sg13g2/spi/config.mk
5 #DESIGN_CONFIG=./designs/ihp-sg13g2/riscv32i/config.mk
6 #DESIGN_CONFIG=./designs/ihp-sg13g2/masked_aes/config.mk
```

The gcd example is selected for the next run.

## Section 3

The designs to run

# gcd (greatest common denominator)

- The gcd design is included with the OpenROAD-flow-script examples.
- It consists of only a single Verilog file, easy to read.
- Should run on the course server in a few minutes.

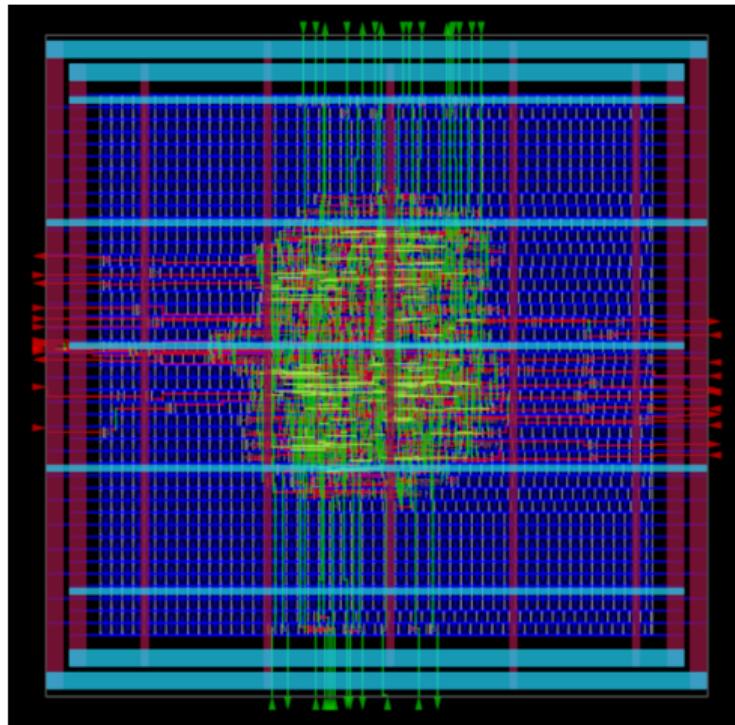

Figure 2: GDS gcd

## gcd files:

```
1 | /src/gcd$ ls  
2 | gcd.v  
3 | README.md
```

```
1 | /ihp-sg13g2/gcd$ ls  
2 | autotuner.json  
3 | config.mk          (important)  
4 | constraint.sdc    (important)  
5 | metadata-base-ok.json  
6 | rules-base.json
```

# ibex: RISC-V core

- The ibex design is included with the OpenROAD-flow-script examples.
- It consists of many Verilog files, not that easy to read.
- A single run might take more than 30 minutes on the course server.

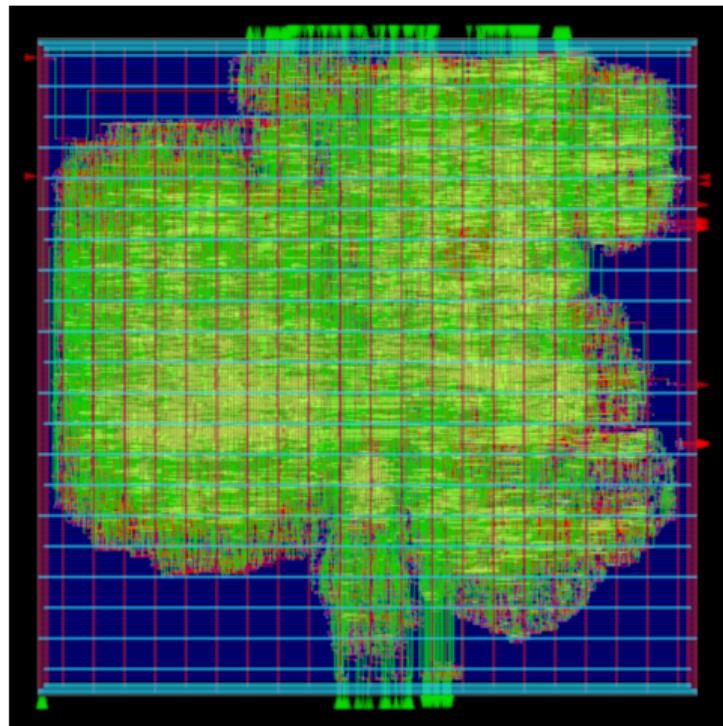

Figure 3: GDS ibex

## ibex files:

```
1 src/ibex$ ls
2 ibex_alu.v           ibex_ex_block.v      ibex_register_file_ff.v   prim_ram_1p.v
3 ibex_branch_predict.v ibex_fetch_fifo.v    ibex_register_file_fpga.v prim_secded_28_22_dec.v
4 ibex_compressed_decoder.v ibex_icache.v     ibex_register_file_latch.v prim_secded_28_22_enc.v

10 ibex_decoder.v       ibex_pmp.v         prim_generic_ram_1p.v README.md
11 ibex_dummy_instr.v   ibex_prefetch_buffer.v prim_lfsr.v
```

```
1 ihp-sg13g2/ibex$ ls
2 autotuner.json
3 config.mk
4 constraint_doe.sdc
5 constraint.sdc
6 metadata-base-ok.json
7 rules-base.json
```

# masked\_aes

- The masked\_aes design is part of a research project and is available on Github:
  - HEP Alliance - Masked AES
- It consists of three Verilog files, one of them >2000 lines of code.
- Should run in a few minutes on the course server.

## Special Features:

- Contains I/O Pads and a Padring
- Has a README that contains the how-to of a sealring
- Has a README that links to the Metall filler script

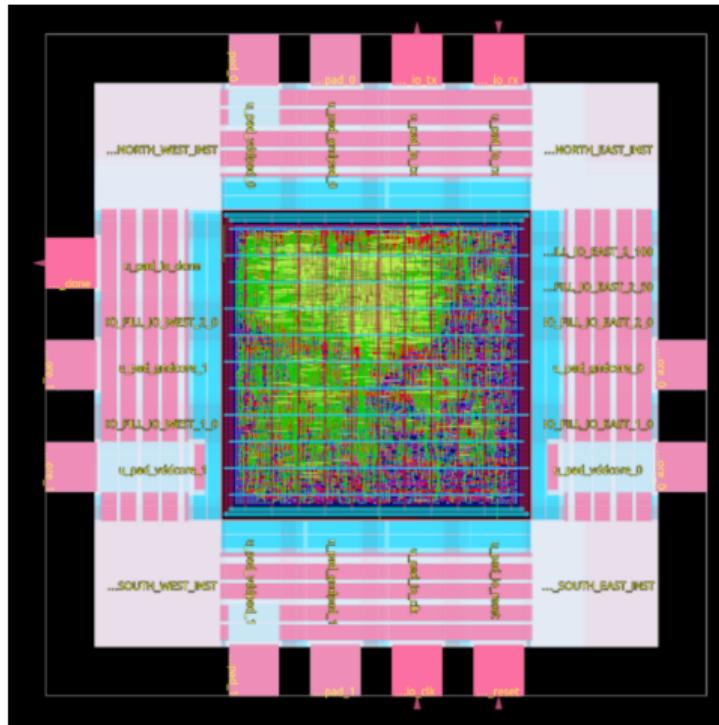

Figure 4: GDS masked\_aes

## masked\_aes files:

```
1 ihp-sg13g2/masked_aes$ ls
2 config.mk

4 MaskedAes.v
```

# Ifsr

- The Ifsr design example must be created from the scratch.
- The Verilog code is available in the lecture slides of chapter 3 and should become a single file.
- The structure of other examples must be copied for this.
- The configuration files must be copied and adapted for this.
- A single run should be very short.

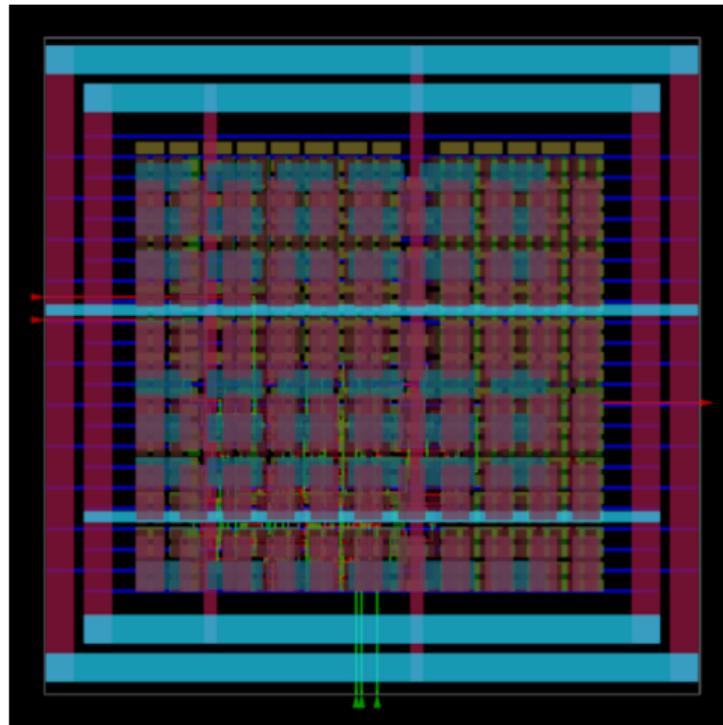

Figure 5: GDS IFSR

# A TinyTapeout design?

- The design example must be created from the scratch.
- The Verilog code is available as open-source via TinyTapeout
- The structure of other examples must be copied for this.
- The configuration files must be copied and adapted for this.
- The run time is unpredicted.

Suggestion:

The VGA clock example from the pictures earlier:

[https://tinytapeout.com/runs/ttihp0p2/tt\\_um\\_vga\\_clock](https://tinytapeout.com/runs/ttihp0p2/tt_um_vga_clock)

## Recap questions for Chapter 4

# Questions

Chapter 04 -  
OpenROAD first  
run -  
QUESTIONS

Course authors  
(Git file)

- How to choose the design for a run?
- How to do a run of ORFS?
- What is expected for a succesfull run?
- Name some of the steps in the console output that gets created during the run.
- What is the content of the final table?

## Chapter 04 - OpenROAD first run - TRAINING - Advanced

Course authors (Git file)

- 1 Build an external example
- 2 Examine the results

# “masked AES” from the HEP Alliance

## Task: Clone the design

- Clone the masked AES design from Github.
- Use the tutorial from the HEP Alliance Repository:  
<https://github.com/HEP-Alliance/masked-aes-tapeout>
- In a nutshell (clone via https):

```
1 | git clone https://github.com/HEP-Alliance/masked-aes-tapeout.git <ORFS-Root>/flow/designs/ihp-sg13g2/masked_aes
```

# Makefile

## Task: Enable the design

- Navigate to the `/flow` folder
- Edit the Makefile:
  - Uncomment the line with your chosen DESIGN\_CONFIG from ihp-sg13g2. In this case the cloned masked\_aes:

```
1 DESIGN_CONFIG=./ designs/ihp-sg13g2/masked_aes/config.mk
```

- Re-comment the previous uncommented line with DESIGN\_CONFIG.
- The line with the default design does not need to be commented. This only applies when no previous line with DESIGN\_CONFIG is set.

# Run

Task: Run ORFS with the design

- Run `make` from inside the `/flow` folder.

# Success

- The chosen design should finish after a while and a lot of console output with a table (time/memory) like this:

	Log	Elapsed	seconds	Peak	Memory/MB
1					

CONGRATS! Your design got build to a GDS!

# The flow steps

## Task: Match the shell output

- Scroll the shell output from the command to the (successfull) end,
- Identify the flow steps in the shell output
- Try to match your findings to the flow steps and flow components from chapter 2
- Can you identify single open-source tools in the output of the flow? Name the ones you identified.

# The GDS

## Task: Examine the GDS

- See the GDS with the command `make gui_final`

## Task: Save an image from the GDS

- In the TCL console at the bottom of the GUI:
  - `save_image <imagename>.png`
  - Find the saved image in your directories.

## Chapter 04 - OpenROAD first run - TRAINING - Bonus

Course authors (Git file)

1

## Create a new design

# Create a new design

In this training session you will integrate a new design for using it with OpenROAD flowscripts.

You can either:

- Have your own design ready.
- Take an opensource design from someone else.

# Pick a design to integrate

## Task: Choose a design

- LFSR from earlier?
- TinyTapeOut design? (See earlier Bonus Training)
- Write a new Verilog file with your own design idea.

# Create a new design in ORFS

## Task: Insert a new design

- In the `flow/designs/src` directory: create new design
- Create or copy Verilog to there
- In the `flow/designs/ihp-sg13g2` directory: create a new design(same name as in src)
- Create or copy the `config.mk` and `constraints.sdc` from the gcd example to there
- Modify both files to match the Verilog src file and top module.

# Makefile

## Task: Enable the design

- Navigate to the `/flow` folder
- Edit the Makefile:
  - Uncomment the line with your chosen DESIGN\_CONFIG from ihp-sg13g2. In this case you must create a new line

```
1 DESIGN_CONFIG=./ designs/ihp-sg13g2/<your design>/config.mk
```

- Re-comment the previous uncommented line with DESIGN\_CONFIG.
- The line with the default design does not need to be commented. This only applies when no previous line with DESIGN\_CONFIG is set.

# Run

## Task: Run ORFS with the design

- Run `make` from inside the `/flow` folder.

# Success

- The chosen design should finish after a while and a lot of console output with a table (time/memory) like this:

	Log	Elapsed	seconds	Peak	Memory/MB
1					

CONGRATS! Your design got build to a GDS!

# The GDS

## Task: Examine the GDS

- See the GDS with the command `make gui_final`

## Task: Save an image from the GDS

- In the TCL console at the bottom of the GUI:
  - `save_image <imagename>.png`
  - Find the saved image in your directories.

## Chapter 04 - OpenROAD first run - TRAINING - Common

Course authors (Git file)

1 gcd example

2 ibex: RISC-V

# gcd example

Start the OpenROAD flow scripts for the gcd example. ORFS shall create a GDS in this run.

# Makefile

## Task: Enable the gcd design in the Makefile

- Navigate to the `/flow` folder
- Edit the Makefile:
  - Uncomment the line with `DESIGN_CONFIG` from `ihp-sg13g2` for the gcd example:

```
1 DESIGN_CONFIG=./ designs/ihp-sg13g2/gcd/config.mk
```

- Re-comment the previous uncommented line with `DESIGN_CONFIG`.
- The line with the default design does not need to be commented. This only applies when no previous line with `DESIGN_CONFIG` is set.

# Run

Task: Run ORFS with the design

- Run `make` from inside the `/flow` folder.

# Success

- The chosen design should finish after a while with a table (time/memory) like this:

	Log	Elapsed seconds	Peak Memory/MB
1	1_1_yosys	0	24
2	1_1_yosys_canonicalize	0	17
3	1_1_yosys_hier_report	0	12
4	2_1_floorplan	0	110
5	2_2_floorplan_io	0	106
6	2_3_floorplan_tdms	0	98
7	2_4_floorplan_macro	0	106
8	2_5_floorplan_tapcell	0	105
9	2_6_floorplan_pdn	0	108
10	3_1_place_gp_skip_io	0	108
11	3_2_place_iop	0	107
12	3_3_place_gp	0	320
13	3_4_place_resized	0	289
14	3_5_place_dp	0	112
15	4_1_cts	1	379
16	5_1_grt	0	340
17	5_2_route	93	899
18	5_3_fillcell	0	111
19	6_1_fill	0	113
20	6_1_merge	1	368
21	6_report	1	292
22	Total	96	899

# The flow steps

## Task: Match the shell output

- Scroll the shell output from the command to the (successfull) end,
- Identify the flow steps in the shell output
- Try to match your findings to the flow steps and flow components from chapter 2
- Can you identify single open-source tools in the output of the flow? Name the ones you identified.

# The GDS

## Task: Examine the GDS

- See the GDS with the command `make gui_final`

## Task: Save an image from the GDS

- In the TCL console at the bottom of the GUI:
  - `save_image <imagename>.png`
  - Find the saved image in your directories.

# Task: Create a GDS of the ibex design

- Do the same as with the gcd example, but now for the ibex example.
- Do the steps from above:
  - Makefile: Enable ibex design
  - Run ORFS with `make`
  - Examine the shell output
  - See the GDS with `make gui_final`
  - Save an image of the GDS.

**Be aware:** This ORFS run will take more than 30 minutes to finish!

## Cheatsheet - Chapter 5 PDK Examination

### KLayout:

.lyp	Layer properties file
.lyt	Technologies file for Layout ↔ Technology mapping

### xScheme:

.sym	Schematics file

### Hardware Description Languages (HDL):

Verilog
VHDL

### Abbreviations:

LVS	Layout versus Schematic
CDL	Circuit design language
GDS II	Graphic data system (II)
LEF	Library exchange format
techLEF	Additional info about the technology
.lib	Liberty timing file: ASCII descriptions of timing / power of cells.

1 What is a PDK?

2 Open-Source PDK and GitHub

3 Content of the PDK ihp-sg13g2

4 File formats

5 Ruleset documents

## Section 1

What is a PDK?

# Wikipedia definition

**A process design kit (PDK)** is a set of files used within the semiconductor industry to model a fabrication process for the design tools used to design an integrated circuit. The PDK is created by the foundry defining a certain technology variation for their processes. ...

... The designers use the PDK to design, simulate, draw and verify the design before handing the design back to the foundry to produce chips. The data in the PDK is specific to the foundry's process variation and is chosen early in the design process, influenced by the market requirements for the chip. An accurate PDK will increase the chances of first-pass successful silicon.

Source: [https://en.wikipedia.org/wiki/Process\\_design\\_kit](https://en.wikipedia.org/wiki/Process_design_kit)

# Open-source viewpoint

ToDo: Image of the border between development and production

# In the context of this course

## Section 2

Open-Source PDK and GitHub

# Difference from closed source

With publishing a PDK under a open-source license, the development from there on becomes a worldwide visible joint effort. The number of contributors and authors of the PDK can only increase from here on.

# Collaborative workflow in GitHub

Some of the main principles of open-source are the permissions to use, study, change and re-distribute the published code and data according to the license. This leads to a open collaboration in which everyone can participate.

GitHub enables a workflow that was designed and build with these principles and opportunities in mind. A good starting point to explore the open collaboration in the IHP PDK are

- **Issues (open and closed)**
- **Pull requests (open and closed)**

The topics and discussions that you can read and study there will draw a picture of how the process of open collaboration works for the PDK.

**Tip:**

Know about the permissions, conditions and limitations of the licenses you are using for your projects!

## Section 3

Content of the PDK ihp-sg13g2

# The README

The Readme file in the PDKs repository is the starting point for information about the content of the PDK.

<https://github.com/IHP-GmbH/IHP-Open-PDK/blob/main/README.md>

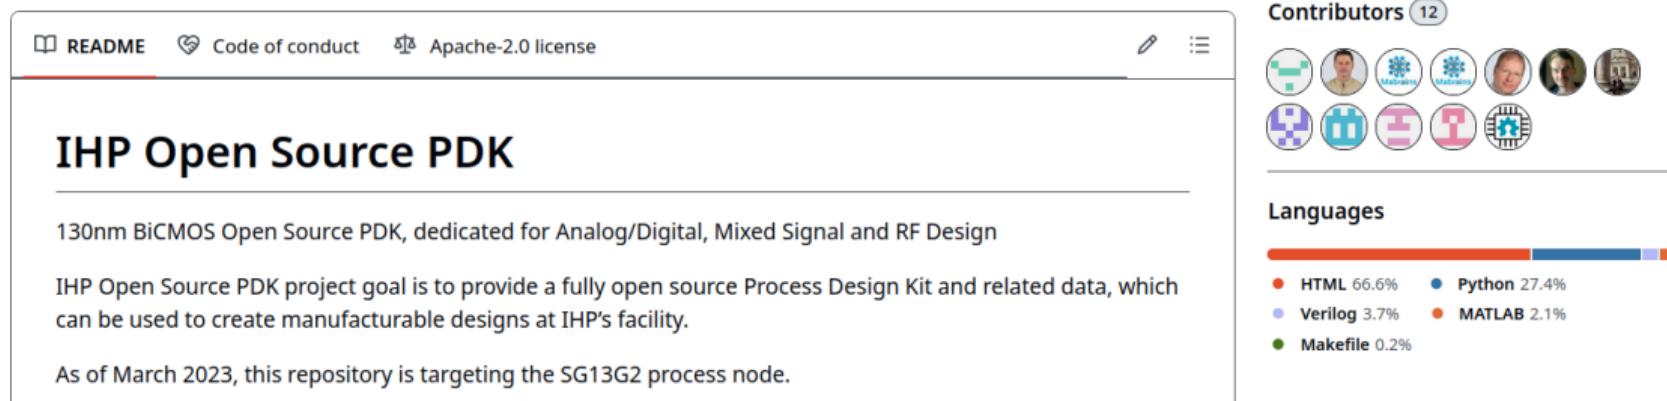

Figure 4: Readme

# Project roadmap

A GANTT chart of the roadmap for the open-source PDK is available under this weblink. It shows the projects timeline (2022 - 2026):

[https://github.com/IHP-GmbH/IHP-Open-PDK/blob/main/ihp-sg13g2/libs.doc/roadmap/open\\_PDK\\_gantt.png](https://github.com/IHP-GmbH/IHP-Open-PDK/blob/main/ihp-sg13g2/libs.doc/roadmap/open_PDK_gantt.png)

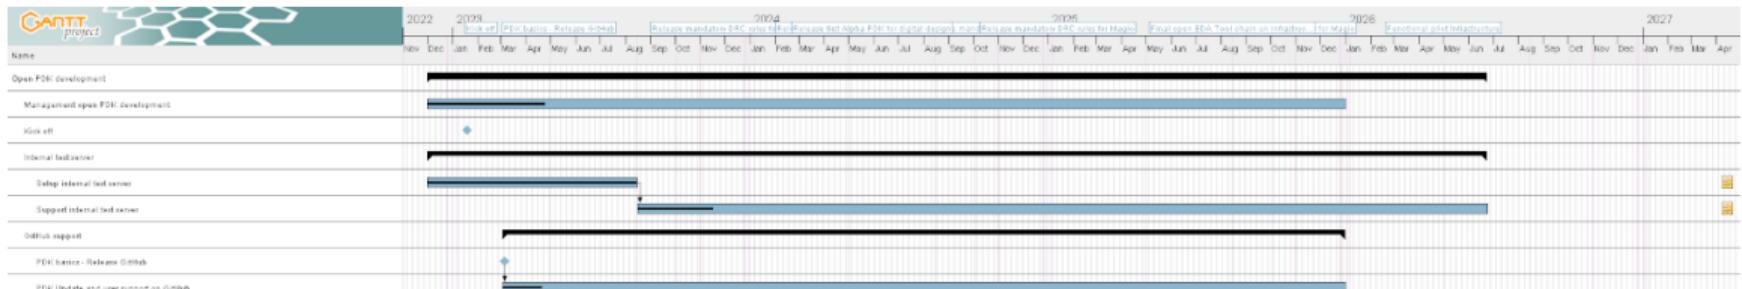

Figure 5: Gantt chart

# Cells in the PDK

There are four different sets of cells (or devices) in the PDK:

- Base cellset with limited set of standard logic cells
  - CDL, GDSII, LEF, Tech LEF
  - Liberty, SPICE Netlist, Verilog
- IO cellset
  - GDSII, LEF, Liberty (dummy), SPICE Netlist
- SRAM cellset
  - CDL, GDSII, LEF, Liberty, Verilog
- Primitive devices
  - GDSII

# Other data in the PDK

- KLayout tool data:
  - layer property and tech files
  - DRC rules (minimal set)
  - PyCells
    - initial version of the wrapper API
    - sample cells
- Pcells (for reference only) libs.tech/pycell
- MOS/HBT/Passive device models for ngspice/Xyce
- xschem: primitive device symbols, settings and testbenches
- OpenEMS: tutorials, scripts, documentation
- SG13G2 Process specification & Layout Rules
- MOS/HBT Measurements in MDM format
- Project Roadmap Gantt chart

# Standard cell library

ToDo:

- Where in the RTI-to-GDS is the cell library needed?
- Design to cells to GDS and Tapeout
- Naming of the cells

# A single cell from the library

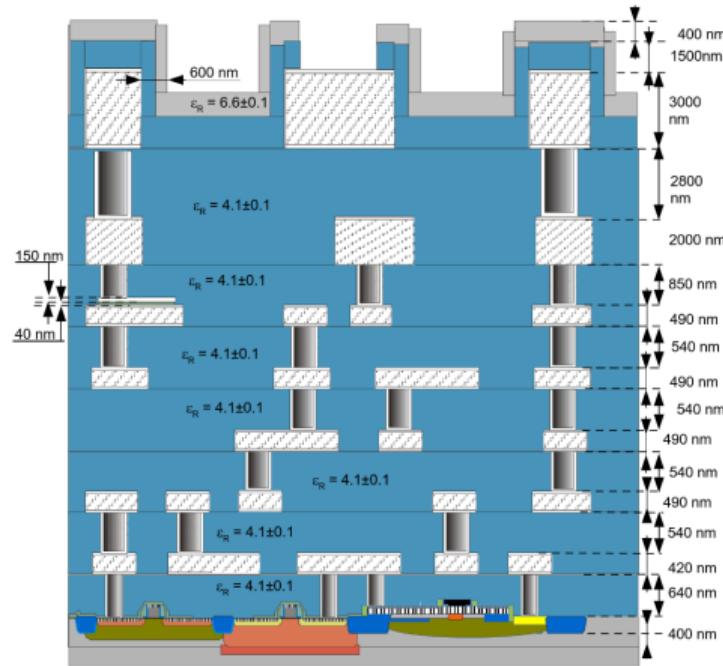

ToDo:

- Pick one cell
- Pictures of the layers of the cell
  - Klayout
  - 3D Rederings?
- Schematic of the cell

# Layer stack

IHP sg13g2 Layers in a picture.

# Layerr table from Stefffen

ToDo: Add Steffens layer table here

# Picture of a cell

ToDo: Insert the 3d rendering of a IHP cell from Tinytapeout. Try to match the layers

## Recap questions for Chapter 5

# Questions

Chapter 5 -  
Process Design  
Kit (PDK) -  
QUESTIONS

Course authors  
(Git file)

- What is a PDK?
- Define the border between development (design) and production of a microchip.
- Where is the (actual) border of open- to closed-source in this?
- Name as many parts of the IHP open-source PDK as you can (round robin)
- What are layers?
- What is a layer stack?
- Can you name some layers and their purpose?
- Try to explain the picture on page XXX of the layout rules document.
- Describe the content of the process specification document.
- Name some of the important file formats from the PDK. What are they used for? (round robin).

# Chapter 5 - PDK Examination - TRAINING - Advanced

Course authors (Git file)

- 1 1. Open Klayout
- 2 2. Matchmaking a cell
- 3 3. Examining cell GDS
- 4 4. Logic function of the cell

# 1. Open Klayout

- Execute `klayout` in console shell.
- Klayout starts in viewer mode.
- Edit mode can be started with `klayout -e` but is not needed for this training.

# 1. Open KLayout

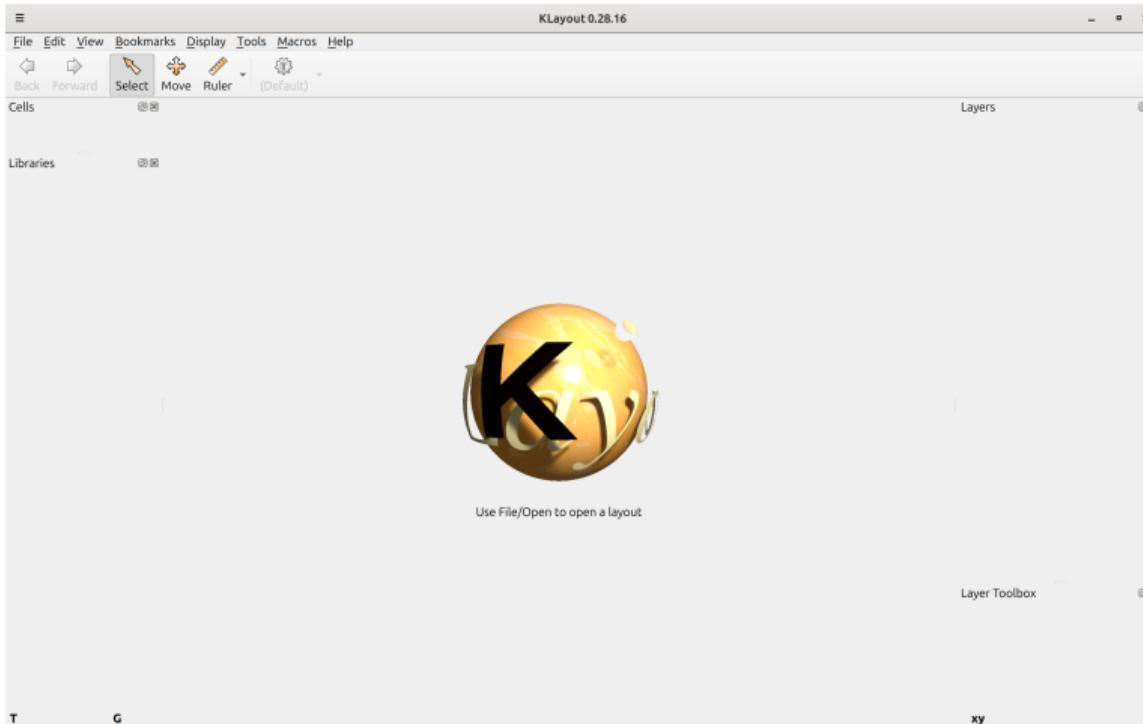

Figure 1: Start KLayout

## 2. Matchmaking a cell

- Here is a 3D rendering of a standard cell (Insert name? Or find name?)
- ToDo: Insert cell picture
- Can you identify the layers and their order from the cell?

## 2. Matchmaking a cell

ToDo.

### 3. Examining cell GDS

Todo. \* Search for the cell GDS and examine the layers and their order.

### 3. Examine cell GDS

Todo. - Picture of

## 4. Logic function of the cell

- Find the schematic of the cell.

## 4. Logic function of the cell

- Match the schematic and the logic function of the cell.

## Chapter 5 - PDK Examination - TRAINING - Bonus

Course authors (Git file)

- 1 1. Transistor count
- 2 Next slide: Solution Spoiler!
- 3 Solution: Transistor count
- 4 Solution: Transistor count in file

# 1. Transistor count

- Load the gds of the standard cell AND4\_1.
- How many transistors are in the cell?
- How to verify this with the use of another file from the PDK?

# Next slide: Solution Spoiler!

## SPOILER ALERT:

- The next slide contains the solution.
- Only proceed to the next slide if you want to see the solution right now!

# Solution: Transistor count

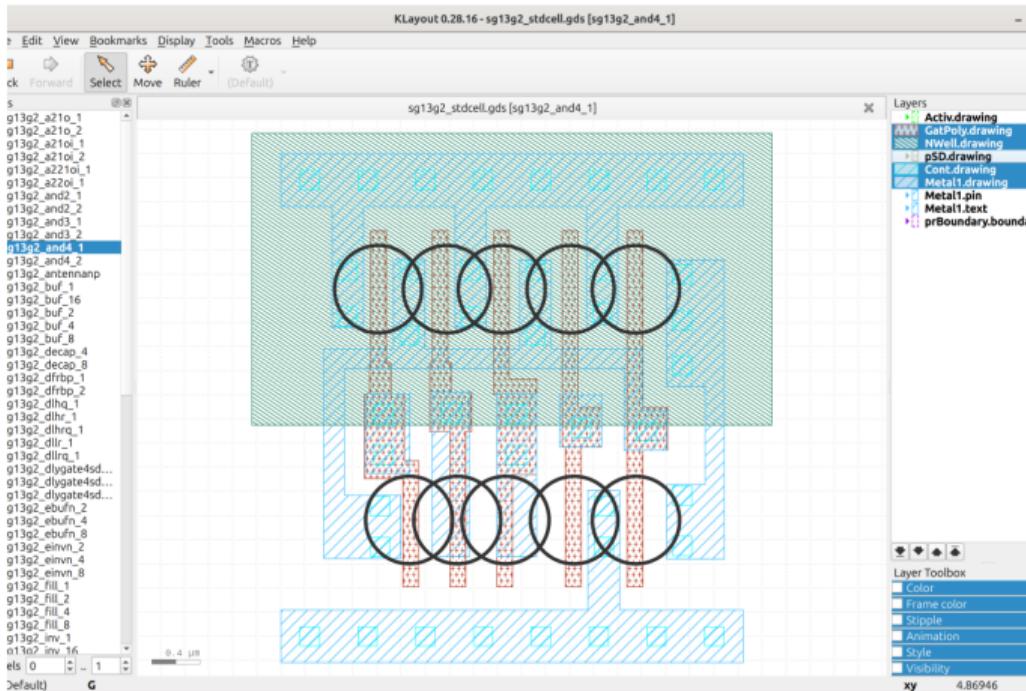

Figure 1: AND4\_1

# Solution: Transistor count in file

```

# Chapter 5 - PDK Examination - TRAINING - Common

Course authors (Git file)

1 1. Open Klayout

2 2. Load example GDS

3 3. Use a LYP file

4 4. Navigate Layers and GDS

5 5. Load cell library GDS

6 6. Pick a cell

# 1. Open Klayout

- Execute `klayout` in console shell.
- Klayout starts in viewer mode.
- Edit mode can be started with `klayout -e` but is not needed for this training.

# 1. Open KLayout

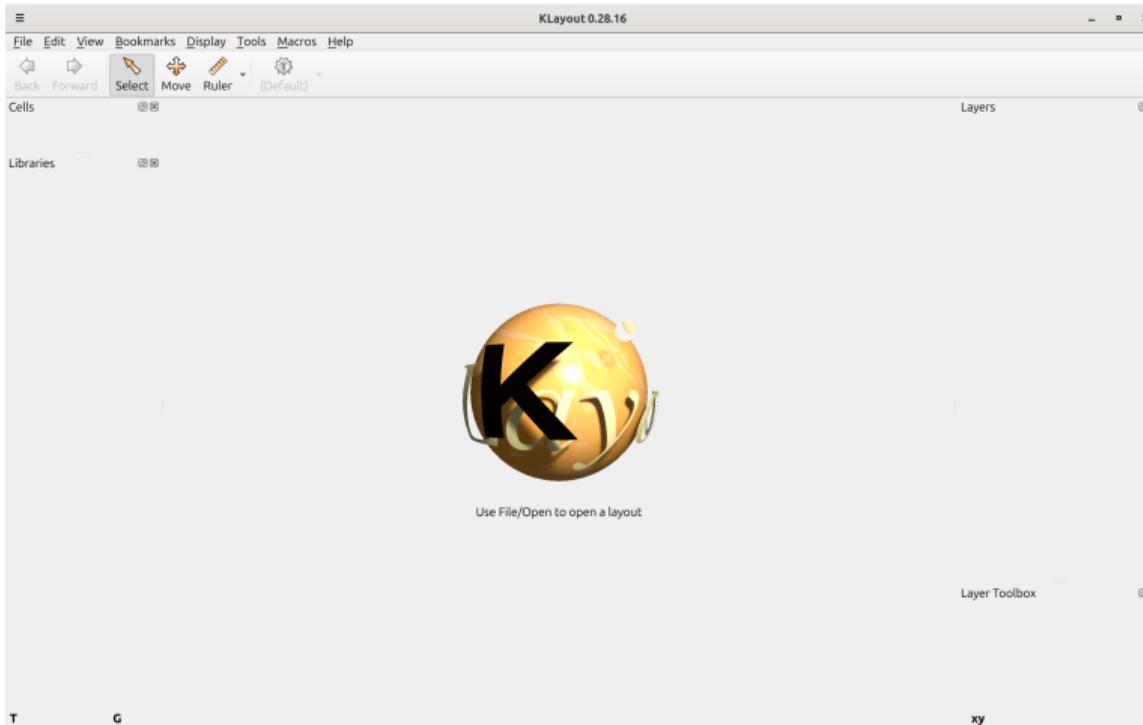

Figure 1: Start KLayout

## 2. Load example GDS

- Search for the final GDS from your example run and load it into Klayoutv

## 2. Load example GDS

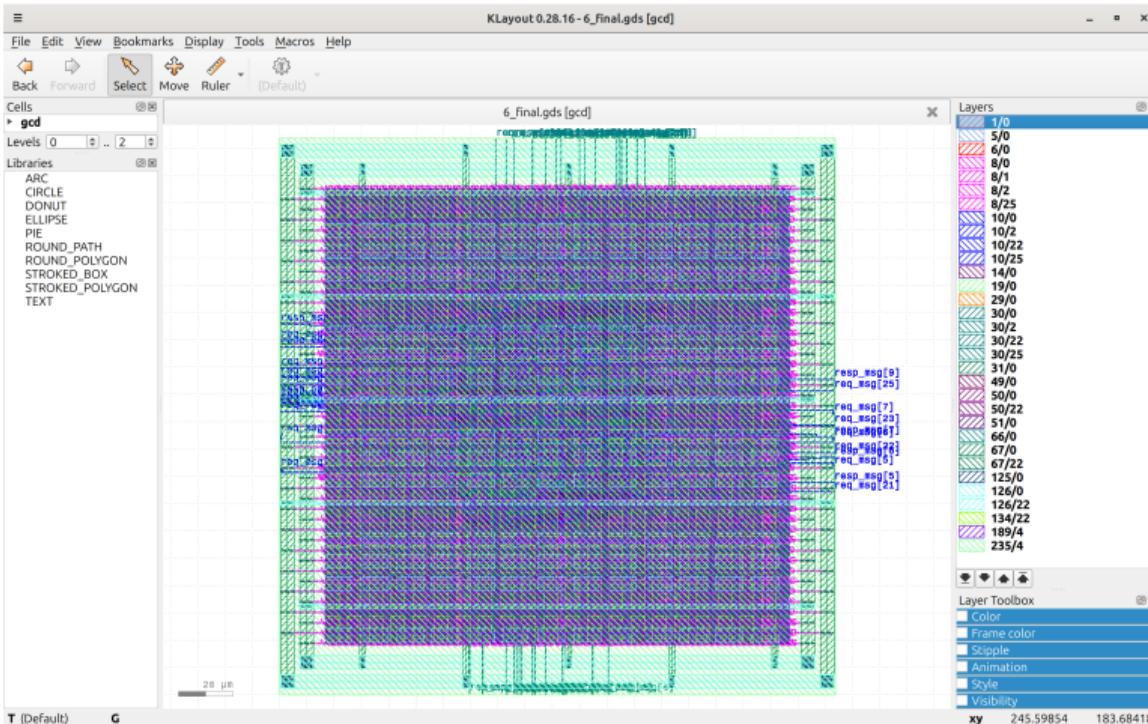

Figure 2: Load GDS

### 3. Use a LYP file

- Recall: What are layer properties and the .lyp file?
- Search the sg13g2 lyp-file from the PDK and enable it in Klayout.
- Make it the default lyp in Klayout.
- Look for changes in the layer list and the GDS.
- What has changed?

### 3. Use a LYP file

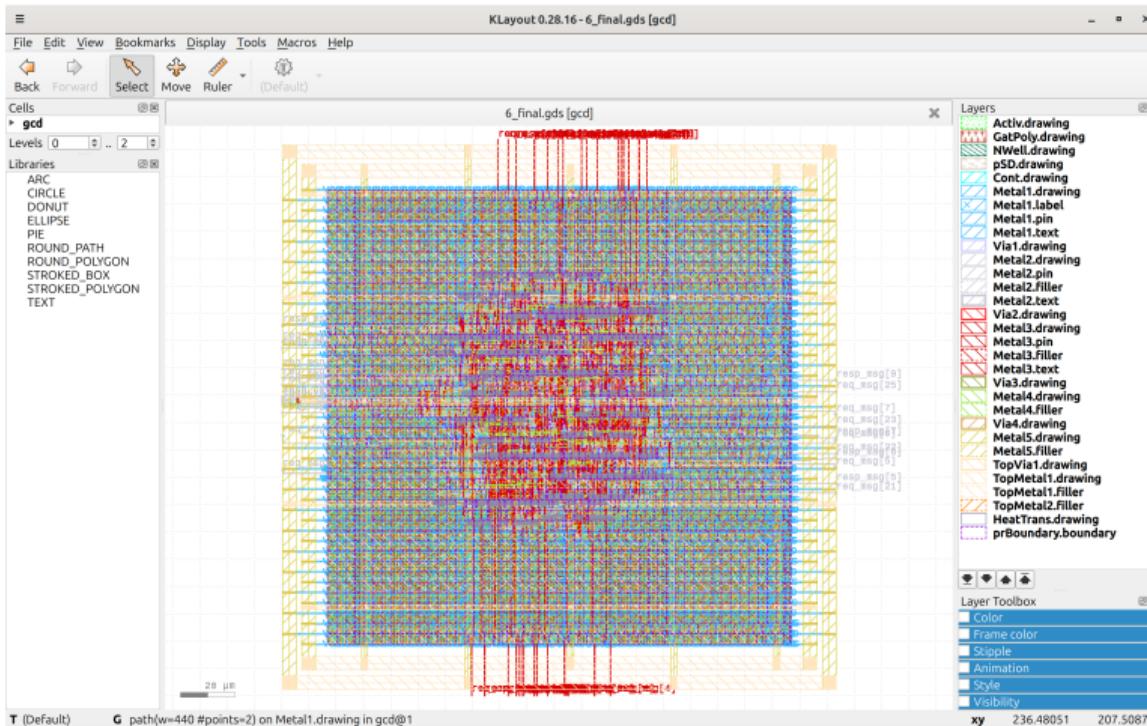

Figure 3: Use LYP file

## 4. Navigate Layers and GDS

- In the layer list:
  - Enable “Hide empty layers”.
  - Enable “Visibility follows selection”.
  - De-/Select multiple layers and see the changes.
- Zoom out to see the complete GDS and de-/select layers.
- Zoom into details and de-/select layers.
- Move the GDS file while zoomed in.
- Try to find interesting views.
- Discuss with neighbours what might be of interest.

## 4. Navigate Layers and GDS

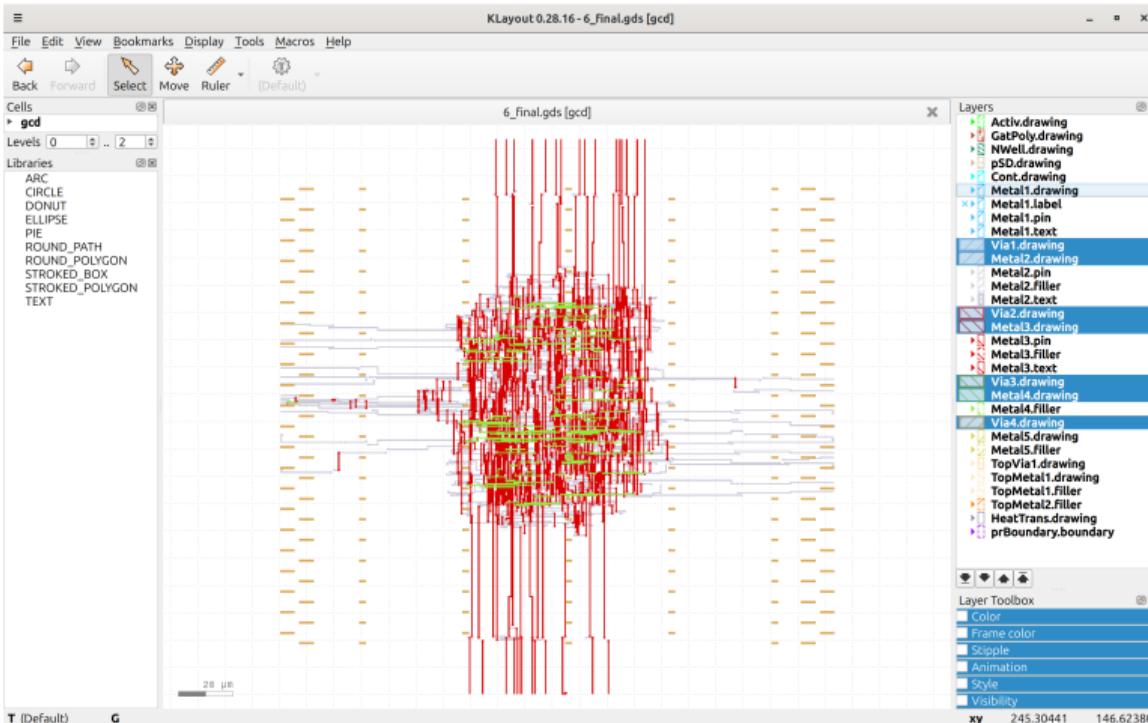

Figure 4: GDS zoomed out

## 4. Navigate Layers and GDS

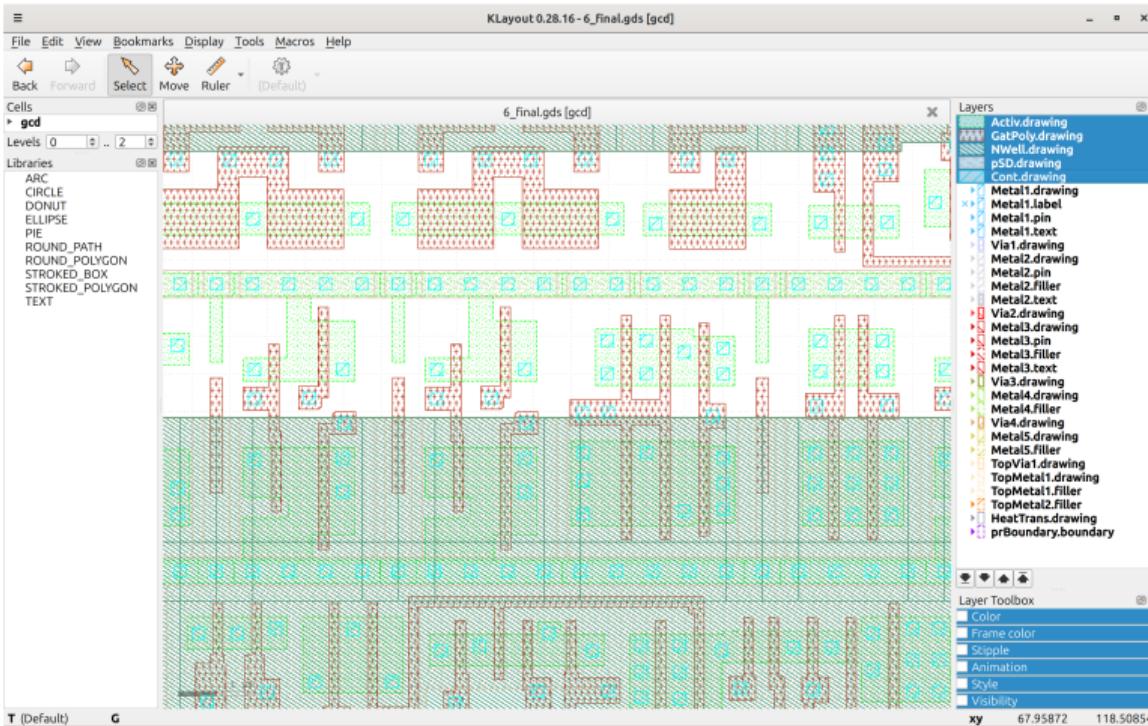

Figure 5: GDS zoomed in

## 5. Load cell library GDS

- Now open another GDS: the standard cell library from the sg13g2 PDK.
- The standard cell library is a single GDS file. Search and load the library file.

## 5. Load cell library GDS

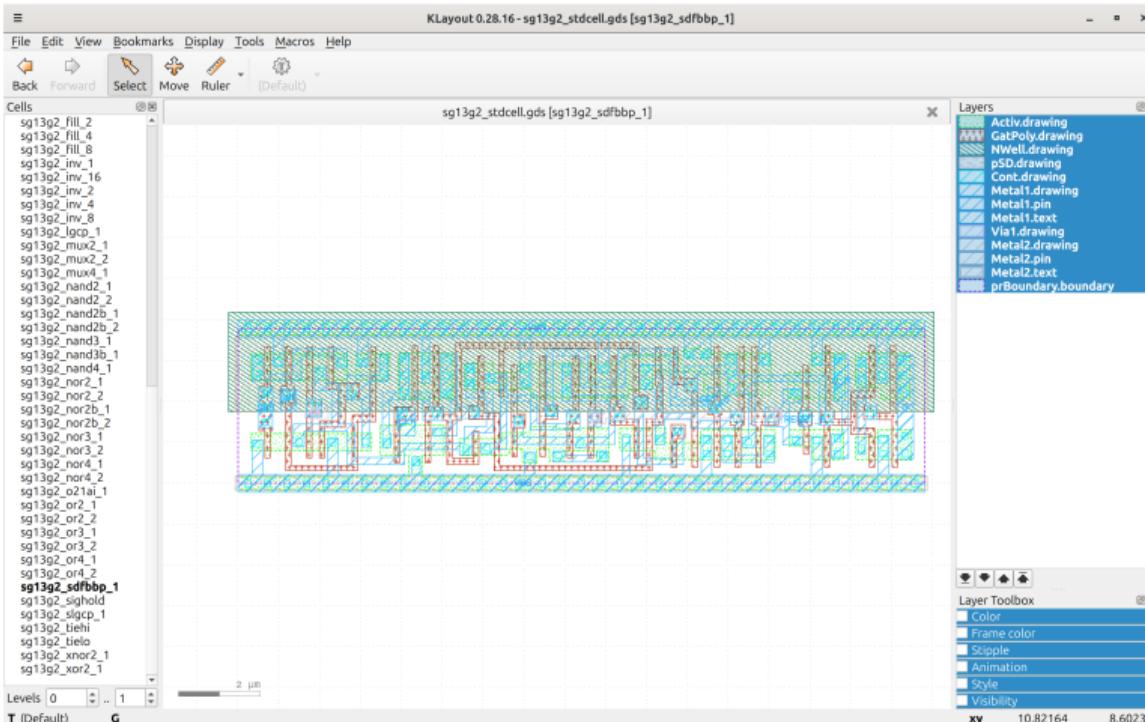

Figure 6: Cell library

## 6. Pick a cell

- All the cell names are displayed in a window to the left. One cell is selected (displayed in bold). The GDS of this cell is viewed. Try to bring another cell “to the top” to see that cells GDS.
- Repeat the layer navigation like in the eaxmple GDS.

# 6. Pick a cell

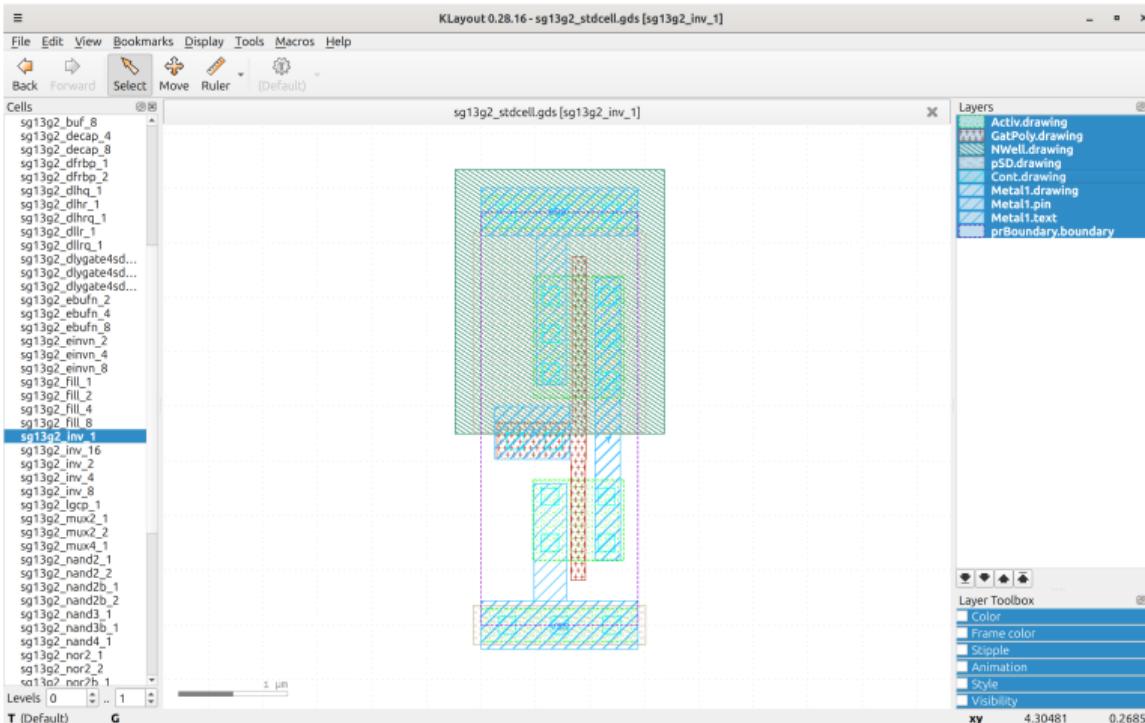

Figure 7: Single cell

## Chapter 6 - OpenROAD GUI

Course authors (Git file)

# 1 Analysing designs with the GUI

## Section 1

Analysing designs with the GUI

# View layout

## Viewing Layout Results

The `make gui_final` command target successively reads and loads the technology `.odb` files and the parasitics and invokes the GUI in these steps:

- Reads and loads `.odb` files.
- Loads `.spf` (parasitics).

The figure below shows the post-routed DEF for the `ibex` design.

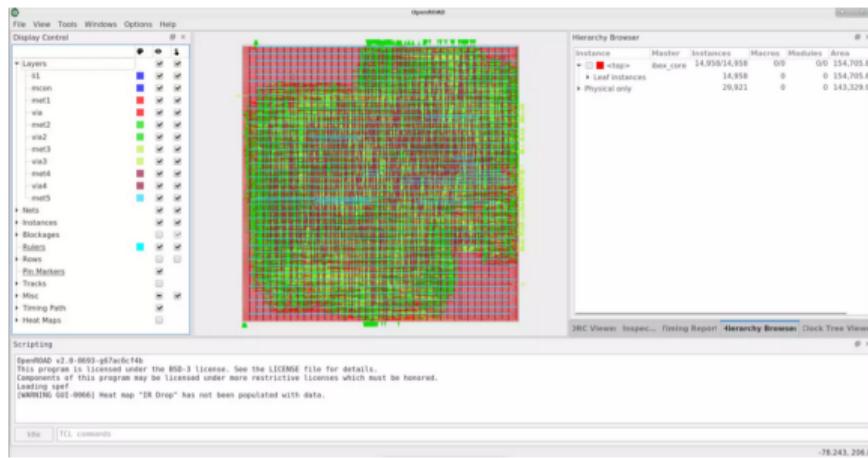

Figure 1: View layout

# View objects

## Visualizing Design Objects And Connectivity

Note the **Display Control** window on the LHS that shows buttons for color, visibility and selection options for various design objects: Layers, Nets, Instances, Blockages, Heatmaps, etc.

The Inspector window on the RHS allows users to inspect details of selected design objects and the timing report.

Try selectively displaying (show/hide) various design objects through the display control window and observing their impact on the display.

Figure 2: View objects

# Clock tree

## Tracing The Clock Tree

View the synthesized clock tree for `ibex` design:

- From the top Toolbar Click `Windows` -> `Clock Tree Viewer`

Figure 3: Clock tree

# Heat maps

## Using Heat Maps

From the Menu Bar, Click on **Tools** -> **Heat Maps** -> **Placement Density** to view congestion selectively on vertical and horizontal layers.

Expand **Heat Maps** -> **Placement Density** from the Display Control window available on LHS of OpenROAD GUI.

View congestion on all layers between 50-100%:

In the **Placement density** setup pop-up window, Select **Minimum** -> **50.00%** **Maximum** -> **100.00%**

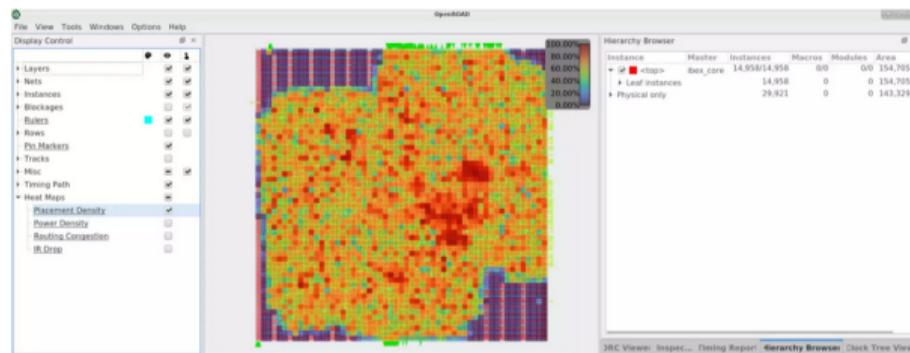

Figure 4: Heat maps

# Timing report

## Viewing Timing Report

Click **Timing** -> **Options** to view and traverse specific timing paths. From Toolbar, click on the **Timing** icon, View **Timing Report** window added at the right side (RHS) of GUI as shown below.

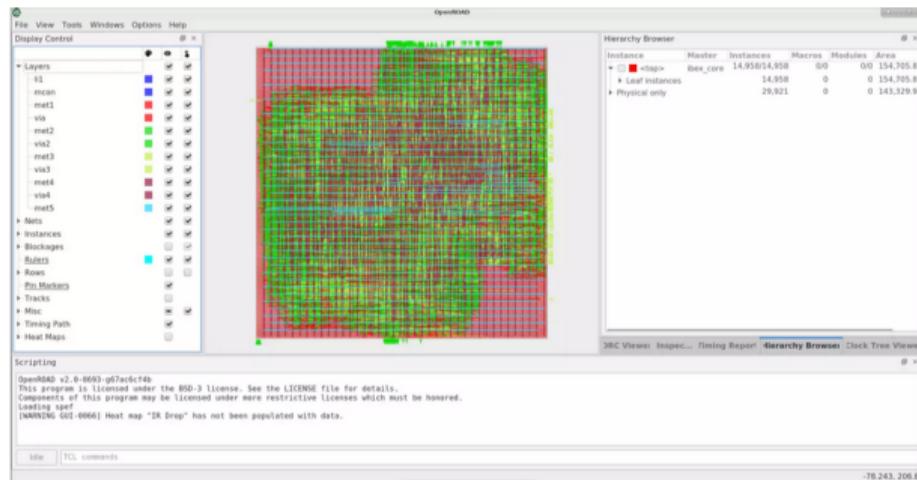

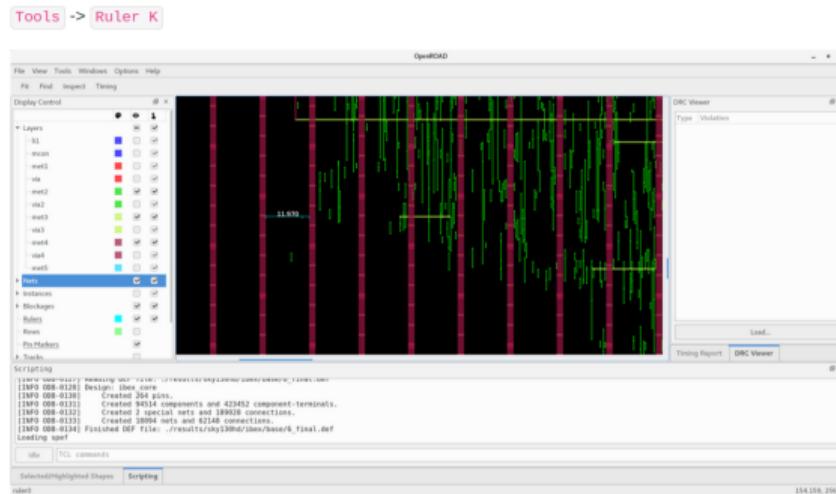

Figure 5: Timing report

# Rulers (measure distances)

## Using Rulers

A ruler can measure the distance between any two objects in the design or metal layer length and width to be measured, etc.

Example of how to measure the distance between VDD and VSS power grid click on:

Distance between VDD and VSS layer is **11.978**

**Figure 6: Rulers**

# TCL command interface

## Tcl Command Interface

Execute OpenROAD-flow-scripts Tcl commands from the GUI. Type `help` to view Tcl Commands available. In OpenROAD GUI, at the bottom, `TCL commands` executable space is available to run the commands. For example

View `design area` in the `Tcl Commands` section of the GUI:

```
report_design_area
```

Try the below timing report commands to view timing results interactively:

```
report_wns  
report_tns  
report_worst_slack
```

Figure 7: TCL interface

# Area report

## Area

View design area and its core utilization:

```
make gui_final
```

In the [Tcl Commands](#) section:

```
report_design_area
```

View the resulting area as:

```
Design area 191262 u^2 30% utilization.
```

Figure 8: Area report

# Timing slack report

## Timing

Users can view flow results using the command interface from the shell or the OpenROAD GUI to visualize further and debug. Learn more about the [GUI](#).

```
make gui_final
```

Use the following commands in the [Tcl Commands](#) section of GUI:

```
report_worst_slack  
report_tns  
report_wns
```

Note the worst slack, total negative slack and worst negative slack:

```
worst slack -0.99  
tns -1.29  
wns -0.99
```

Figure 9: Timing slack report

# Power report

## Power

Use the report command to view individual power components i.e. sequential, combinational, macro and power consumed by I/O pads.

In the [Tcl Commands](#) section:

```
report_power
```

The power output is as follows:

Group	Internal Power	Switching Power	Leakage Power	Total Power
Sequential	5.58e-03	6.12e-04	1.67e-08	6.19e-03 19.0%
Combinational	9.23e-03	1.71e-02	4.90e-08	2.63e-02 81.0%
Macro	0.00e+00	0.00e+00	0.00e+00	0.00e+00 0.0%
Pad	0.00e+00	0.00e+00	0.00e+00	0.00e+00 0.0%
Total	1.48e-02 45.6%	1.77e-02 54.4%	6.57e-08 0.0%	3.25e-02 100.0%

Figure 10: Power report

1

## Guess and rebuild

# Challenge 1

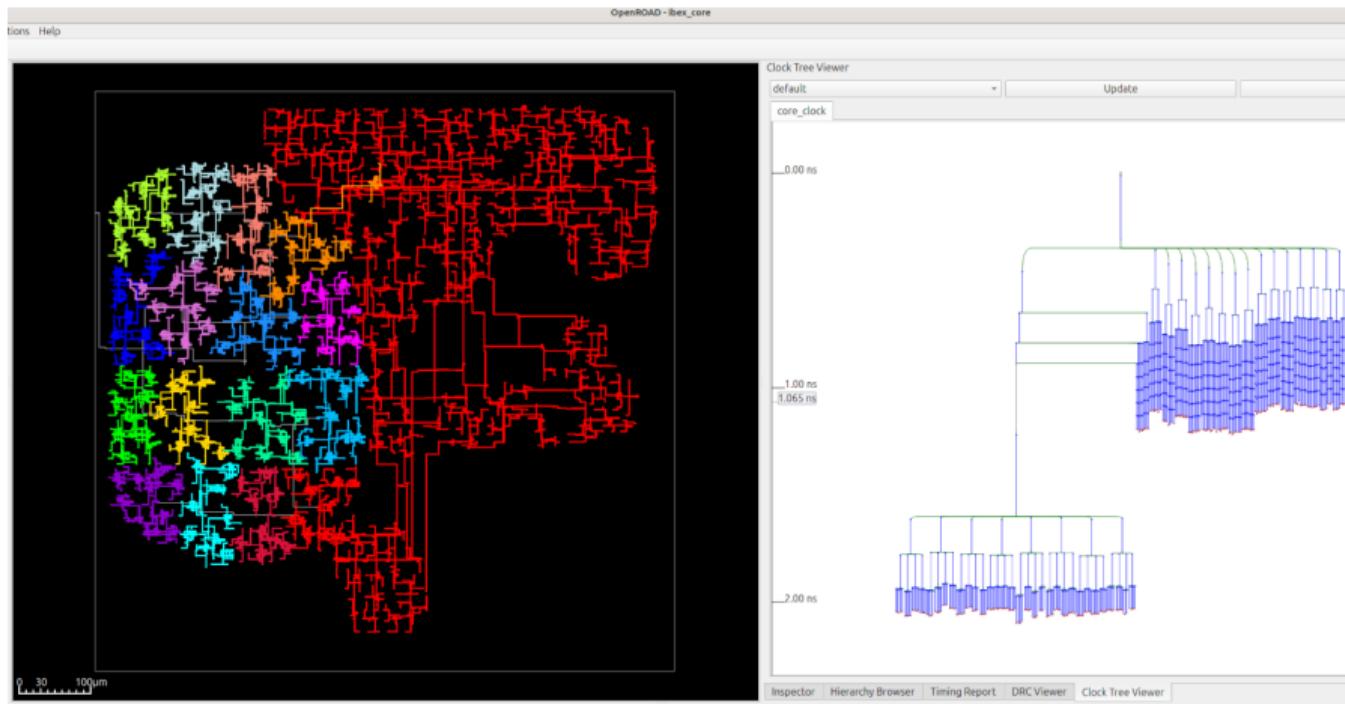

Figure 1: What is this?

## Challenge 2

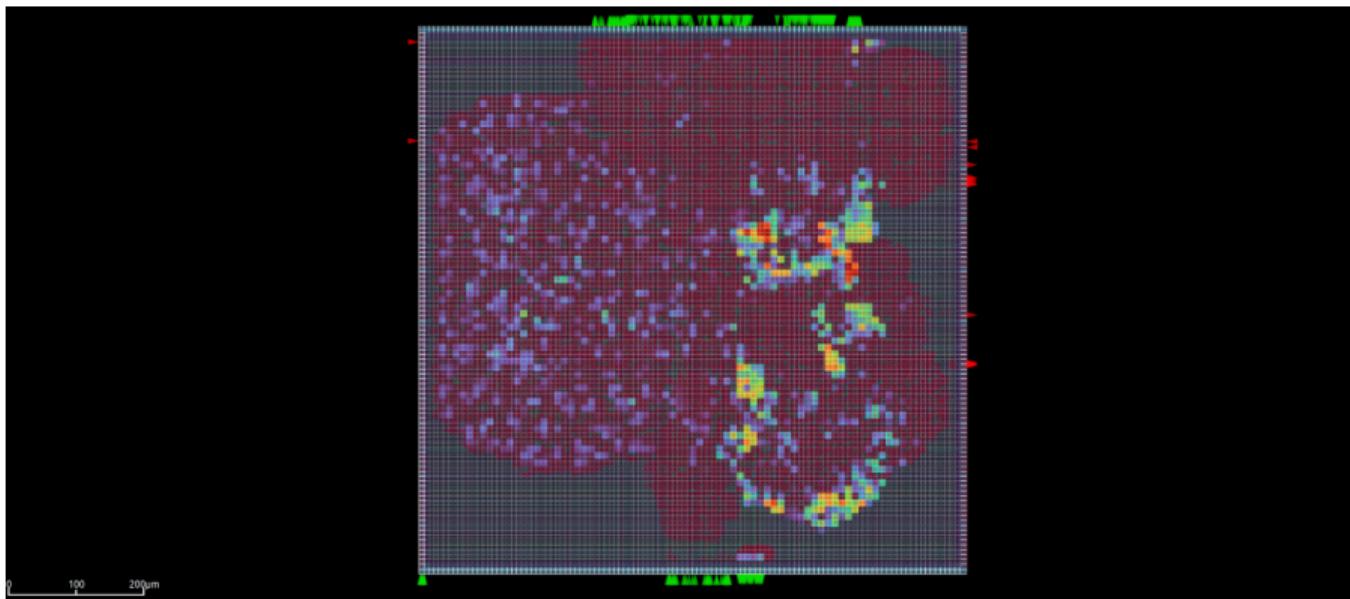

Figure 2: What is this?

Rebuild the picture with any design!

# Challenge 3

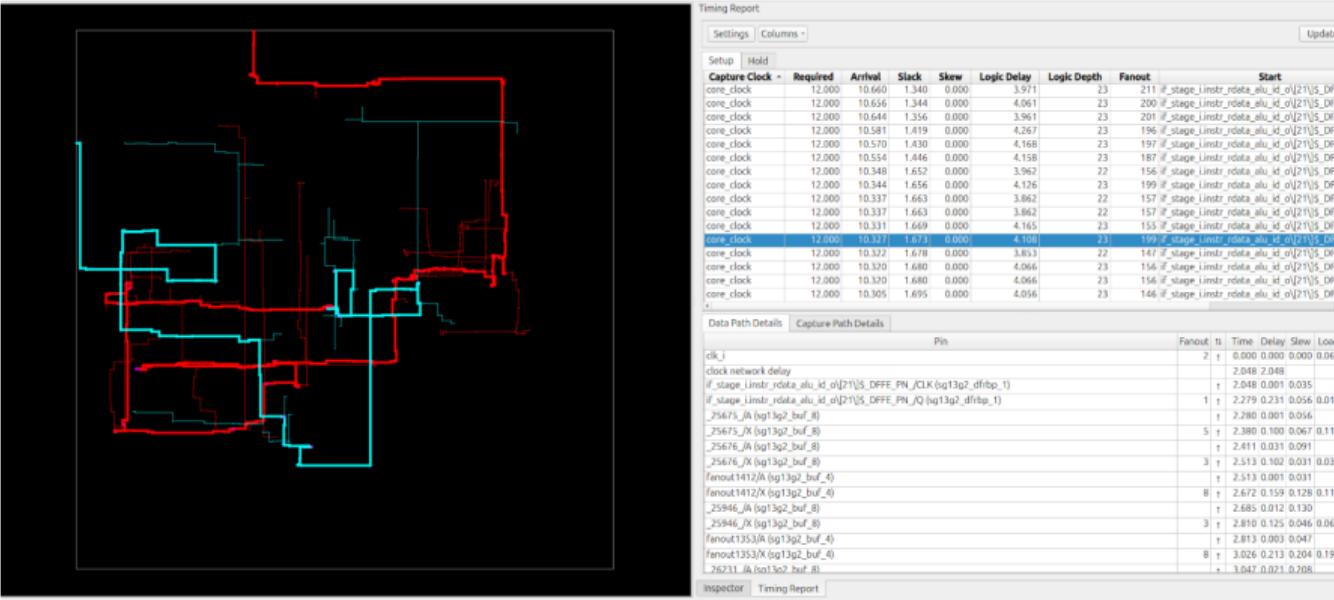

Figure 3: What is this?

Rebuild the picture with any design!

# Challenge 4

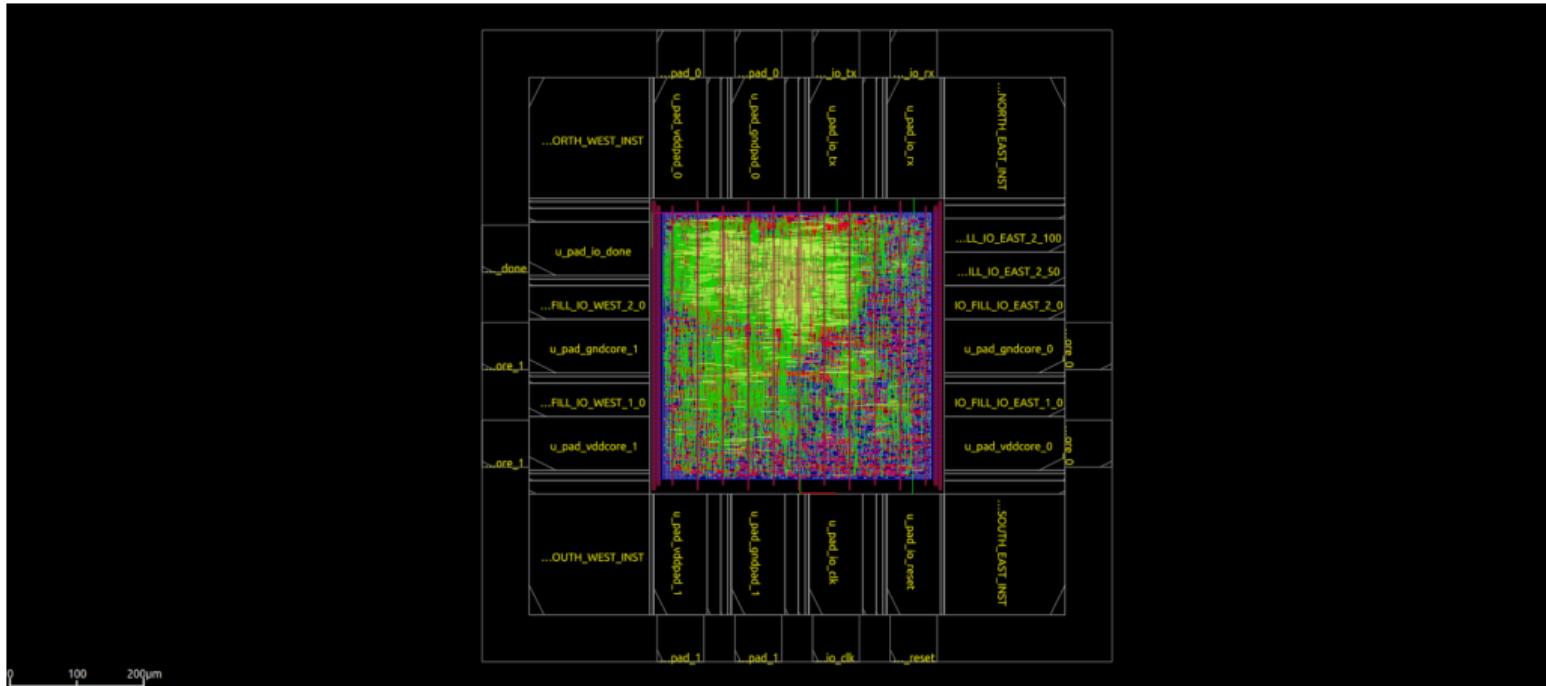

Figure 4: What is this?

# Solutions (of the challenges)

- ① Ibex clocktree without most other layers (IHP PDK)
- ② Ibex power density >15 uW (IHP PDK)
- ③ Ibex single clock path with all layers off, but the timing paths (IHP PDK)
- ④ Masked aes without most metals and only pins names (IHP PDK)

# Chapter 7 - OpenROAD flow scripts

Course authors (Git file)

- 1 What are we going to do now?
- 2 The tools in ORFS
- 3 Structure of flow directories
- 4 Important data locations
- 5 Design config variables

## Section 1

What are we going to do now?

# Previous chapters

What happened on the way to here:

- GDS-2-RTL: OpenROAD
- OpenROAD flow scripts (ORFS) overview
- ORFS flow steps and flow components
- First run of the flow scripts
- A Dive into the PDK (Klayout)
- Analysing: Heatmaps and more (ORFS GUI)

# This chapter

NOW:

- One day of using ORFS
- Getting a hands on with important data and features.

## Idea of today

There is a good tutorial about ORFS in the official documentation:

<https://openroad-flow-scripts.readthedocs.io/en/latest/tutorials/FlowTutorial.html>

The ORFS online-tutorial was not written for the use with the IHP PDK especially, but we can adopt this easily.

**Introduction**[User Guidelines](#)[Getting Started](#)[Configuring The Design](#)[Running The Automated RTL-to-GDS Flow](#)[Viewing Results And Logs](#)[OpenROAD GUI](#)[Understanding and Analyzing](#)[OpenROAD Flow Stages and Results](#)[Troubleshooting Problems](#)

# OpenROAD Flow Scripts Tutorial

## Introduction

This document describes a tutorial to run the complete OpenROAD flow from RTL-to-GDS using [OpenROAD Flow Scripts](#). It includes examples of useful design and manual usage in key flow stages to help users gain a good understanding of the [OpenROAD](#) application flow, data organization, GUI and commands.

This is intended for:

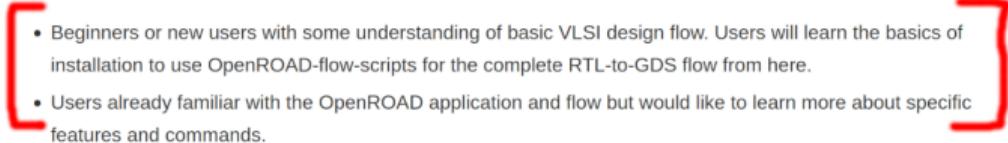

- 
- Beginners or new users with some understanding of basic VLSI design flow. Users will learn the basics of installation to use OpenROAD-flow-scripts for the complete RTL-to-GDS flow from here.
  - Users already familiar with the OpenROAD application and flow but would like to learn more about specific features and commands.

Figure 1: ORFS Online Tutorial

# Lecture and trainings more interactive

## Caveats

- ORFS does not handle multiple runs for a single design.
- The design run must be cleared with make clear\_all, before a new runs can be started.
- !!! The previous data from the previous run will be lost.

Side feature:

- A run can start over where you left it.

My opinion:

- Both should be possible:
  - Keep data
  - Start over where left behind

But it is not.

## Workaround for this

We have to:

- Manually save the previous data.
- Maybe just be renaming the directory.
- make gui\_final only works on the actual design data.

### Training: Multiple design runs

## Section 2

The tools in ORFS

## Section 3

Structure of flow directories

## Section 4

Important data locations

# Logs

- Where to find?
- How to read?

## Platform configurations

# Platform configurations

Make use of the ORFS tutorial, platform configuration:

<https://openroad-flow-scripts.readthedocs.io/en/latest/tutorials/FlowTutorial.html#platform-configuration>

# Compare two platforms

- Open the config.mk files for two platforms in parallel, so you can compare them.
- Platforms: ihp-sg13g2 and sky130hd

Questions:

- How are they similar and different?

# Structure of the config.mk

- Open the config.mk of the platform ihp-sg13g2
- Name the sections of the config.mk

Questions:

- Where have you seen the titles (comments) of the sections before?

# Variables

- Open the config.mk of the platform ihp-sg13g2
- Identify the following variables and find out their meanings / purpose.
- Variables:
  - DONT\_USE\_CELLS
  - IO\_PLACER\_H
  - CORE\_MARGIN and CORE\_UTILIZATION
  - KAYOUT\_TECH\_FILE
  - KAYOUT\_DRC\_FILE

## Questions:

- Where is the information about the variables?
- The meanings and purpose of the variables.
- Is CORE\_UTILIZATION in the config.mk? Why?
- Any other variables you looked up out of interest?

## Chapter 7 - OpenROAD flow scripts - TRAINING - Common

Course authors (Git file)

## Chapter 8 - Tapeout

Course authors (Git file)

1 Open-source Tapeout informations from IHP

2 READMEs

3 Read-the-docs

4 The last steps to a successful Tapeout

## Section 1

Open-source Tapeout informations from IHP

# Open-source Tapeout informations from IHP

This chapter provides information about the Tapeout at IHP. Please follow the links to tag along with the chapter.

# IHP - Repositories structure

- The designs for the open-source Tapeouts are collected as the “Open DesignLib”.
- During the process of each Tapeout there are dedicated repositories by the names TO\_monthyear.
- After Tapeout these designs shall be merged into the Open DesignLib repository.

# PDK and Open DesignLib

- Open.source PDK:

<https://github.com/IHP-GmbH/IHP-Open-PDK>

- Open DesignLib:

<https://github.com/IHP-GmbH/IHP-Open-DesignLib>

# TapeOut repositories (TO)

- Tapeout May 2024:

[https://github.com/IHP-GmbH/TO\\_May2024](https://github.com/IHP-GmbH/TO_May2024)

- Tapeout Nov 2024:

[https://github.com/IHP-GmbH/TO\\_Nov2024](https://github.com/IHP-GmbH/TO_Nov2024)

- Tapeout Dec 2024:

[https://github.com/IHP-GmbH/TO\\_Dec2024](https://github.com/IHP-GmbH/TO_Dec2024)

## Section 2

READMEs

# README file in TO repositories

Important notes:

- Always look for the most actual and stable information
- Tools and workflows change fast
- Design rules don't change fast (if ever)
- Most parts of the PDK are long term stable

# Submission process

Screenshot from the [README TO\\_DEC2024](#):

## Submission process

---

To submit for our OpenMPW run you have to have a valid github account. Make a fork of this repository and then create a separate directory for your design next to the `ExampleDesign` (you can also make a copy and rename it). Structure your data according to our recommendations, update the documentation and push your files to your fork, then make a pull request.

### ⓘ Caution

On each PR a github action will be triggered to run a minimal DRC precheck (rejection test). Please consider it and do not upload many `gds` files.

Once you make a PR a github action will run a minimum set of DRC checks on each `gds` and `gds.zip` file. If the test passes it means that your design is manufacturable at our pilot line not ensuring the reliability. An example of a failure is shown on the following figure

Figure 1: Submission process

# Physical constraints

Screenshot from the [README TO\\_DEC2024](#):

## Physical design constraint

---

1. Please align with the layout design rules which can be found [here](#)
2. The area granted to a community member is  $2 \text{ mm}^2$  It includes the sealring.
3. The sealring can be found among KLayout PyCells.

Figure 2: Physical design constraints

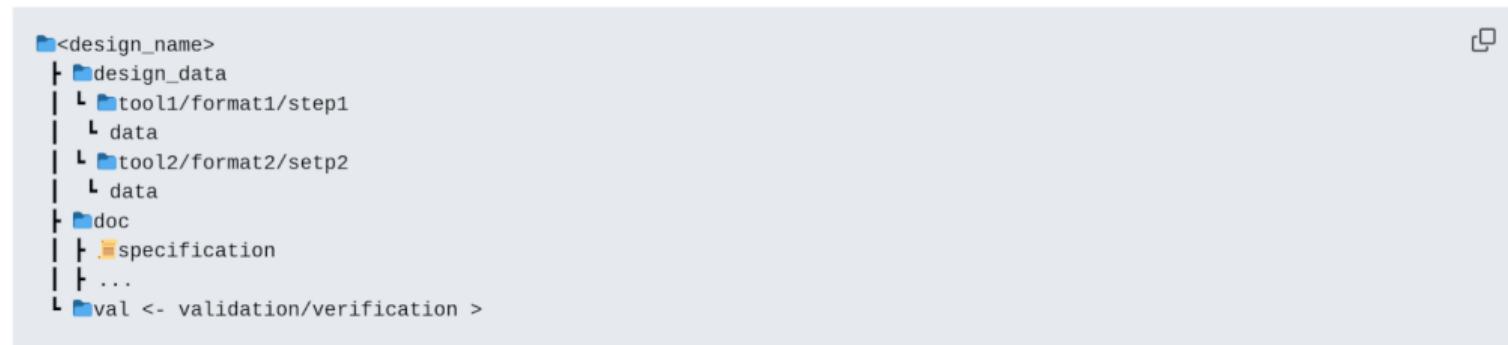

# Project structure

Screenshot from the [README TO \\_DEC2024](#):

## Directory structure

If you are a designer, we propose the following directory structure, which we and the community would appreciate you using. Please ensure that the design you submit is reproducible, meaning it should include all the information necessary to replicate the design.

```
<design_name>
├── design_data
│   ├── tool1/format1/step1
│   │   └── data
│   └── tool2/format2/step2
│       └── data
├── doc
│   ├── specification
│   └── ...
└── val <- validation/validation >
```

The first segmentation separates the `design data` from a `documentation` and `verification/validation data`.

Figure 3: Directories in a project

# Design data structure

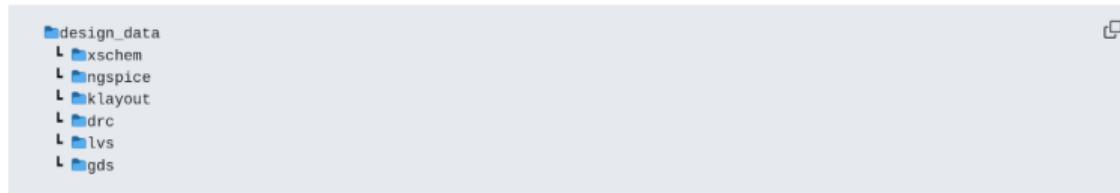

Screenshot from the **README TO \_DEC2024:**

## Design data directory structure

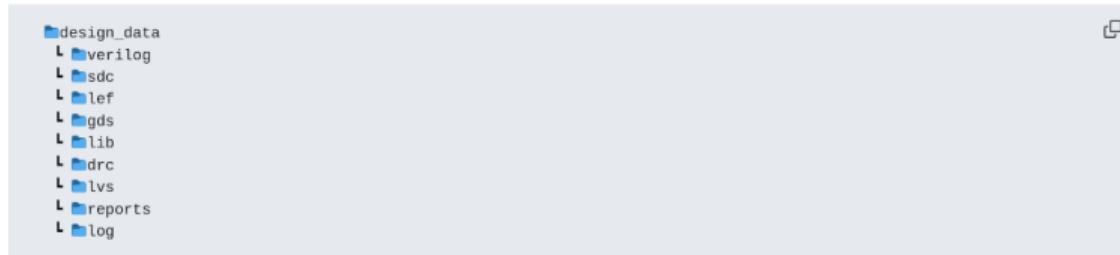

The `design_data` should be structured using tool/format/step specific scheme.

Here you can find some examples:

Example1

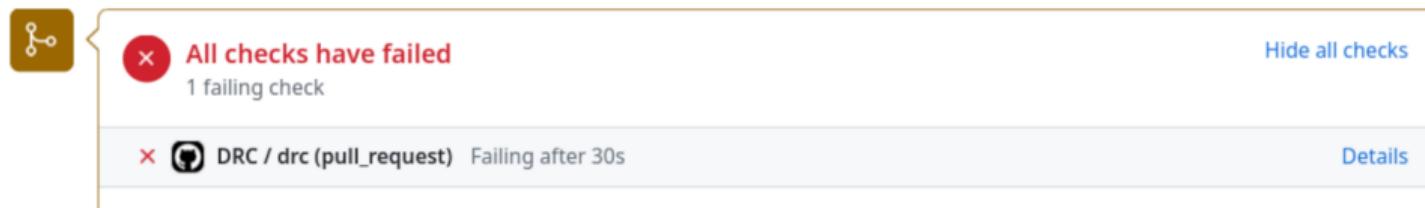

Example2

# DRC

During a submission to a Tapeout the design gets checked with a DRC via Github Actions.

Once you make a PR a github action will run a minimum set of DRC checks on each `gds` and `gds.zip` file. If the test passes it means that your design is manufacturable at our pilot line not ensuring the reliability. An example of a failure is shown on the following figure

The detailed report can be downloaded from a link, which can be found at the end of the section `Details->Archive DRC Results` as show on the image:

Figure 5: DRC via Github actions

## Section 3

Read-the-docs

# Read-the-docs

- Open PDK Docu:

<https://ihp-open-pdk-docs.readthedocs.io/en/latest/index.html>

- Open DesignLib Docu:

<https://ihp-open-ip.readthedocs.io/en/latest/>

# README versus Read-the-docs

- The README version is a extract of the full documentation (read-the-docs) for the DesignLib.
- The read-the-docs version contains the Tapeout calender and further info

# Tapeout calendar

## Welcome to IHP-Open-DesignLib documentation!

IHP-Open-DesignLib is repository, which contains open source IC designs using IHP SG13G2 BiCMOS processs. It is also a central point for design fabrication under the concept of IHP Free MPW runs funded by a public German project [FMD-QNC \(16ME083\)](#). Project funds can be used exclusively to produce chip designs for non-commercial activities, such as university education, research projects, and others. In the project, a continuation for the provision of free area for the open source community is to be worked out.

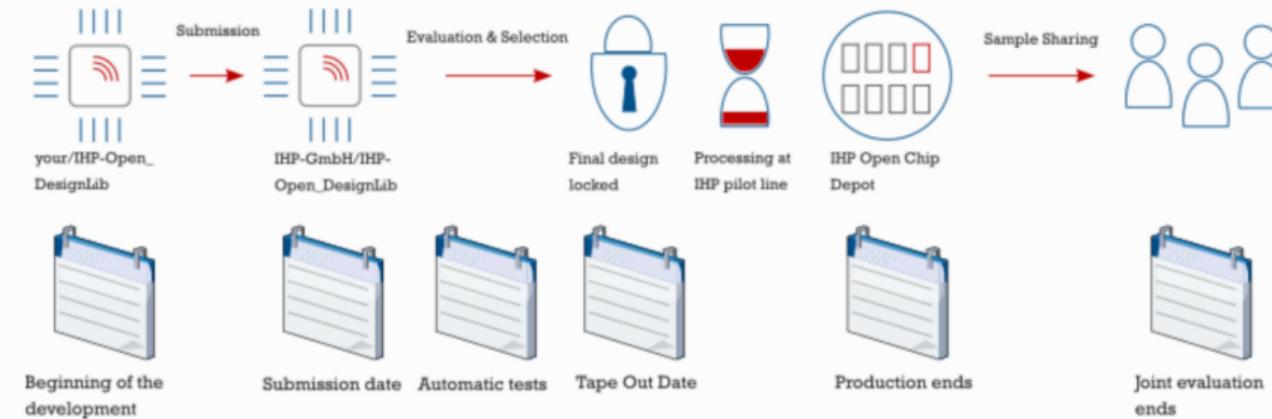

Tape In date	10 May 2024	11 Nov 2024	22 Nov 2024	07 Apr 2025	09 May 2025
Technology	SG13G2	SG13CMOS	SG13G2	SG13G2	SG13G2
Area available [mm <sup>2</sup> ]	10	220	20	140	30

Figure 6: Open DesignLib Tapeout Calendar

# More submission information

The overview of the submission process is shown on the following figure.

The submission process contains a few steps, where some of them are mandatory and crucial:

1. Project development phase. At the beginning specifications and criteria will be defined by PDK status, later specifications from sponsors might be possible

Figure 7: Submission process detailed

## Section 4

The last steps to a successful Tapeout

# The last steps to a successful Tapeout

A few words about the finish of a Tapeout-ready GDS:

- A successfull Tapeout for a producable, correct and working micorchip contains more steps and knowdledge. It is out of scope of the course to explain and tutor these all details about this knowledge.
- Most of these steps will integrate into ORFS soon in a easy-to-use way eventually.

# Topic to watch in design

Till then, here is a (not complete) list of important topics:

- Placement and instantiation of the Input-Outputs.
- Metall fills
- Sealring construction
- Automated DRC free

# Github Actions

- Tapeout Nov 2024 Actions drc.yml:

[https://github.com/IHP-GmbH/TO\\_Nov2024/blob/main/.github/workflows/drc.yml](https://github.com/IHP-GmbH/TO_Nov2024/blob/main/.github/workflows/drc.yml)

- Tapeout Nov 2024 Actions runs:

[https://github.com/IHP-GmbH/TO\\_Nov2024/actions](https://github.com/IHP-GmbH/TO_Nov2024/actions)

# Active development in ORFS

Pull requests in ORFS with the search IHP in it:

<https://github.com/The-OpenROAD-Project/OpenROAD-flow-scripts/pulls?q=IHP+>

The screenshot shows a GitHub repository page for 'OpenROAD-flow-scripts'. The 'Pull requests' tab is selected, showing 53 results. A search bar at the top right contains 'Type [ ] to search'. Below the tabs are filters for 'Labels (44)', 'Milestones (0)', and a 'New pull request' button. A search bar also contains 'IHP'. The main list displays the following pull requests:

- #2744 Reverted AT mods in config.mk's ✓ (merged 3 days ago)
- #2730 update metrics for ppl fix ✓ (merged 4 days ago)
- #2726 ibex autotuner updates for gf180, ihp-sg13g2 and sky130hd ✓ (merged 5 days ago)
- #2723 update Yosys to version 0.49 ✓ (merged 4 days ago)
- #2722 AES AutoTuner updates ✓ (merged 5 days ago)
- #2721 flow: designs: ihp-sg13g2: i2c-gpio-expander: Fix missing IO pwr/gnd ✓ (merged last week)

## Issues in ORFS (open and IHP in it):

<https://github.com/The-OpenROAD-Project/OpenROAD-flow-scripts/issues?q=is%3Aissue%20state%3Aopen%20IHP>

The screenshot shows the GitHub Issues page for the repository "The-OpenROAD-Project / OpenROAD-flow-scripts". The search bar at the top contains the query "is:issue state:open IHP". Below the search bar, there are filters for "Issues" (88), "Pull requests" (53), "Discussions" (0), "Actions" (0), "Projects" (0), "Security" (0), and "Insights" (0). A "Preview" button is visible on the right.

The main list displays eight open issues:

- #2616 - [ERROR] LEF Cell 'spi\_DEF\_FILL' has no matching GDS/OAS cell. Cell will be empty when running ihp-sg13g2 examples (waiting on op)
- #2574 - Min metal area ignored by ORFS (DRC error) (drt) (waiting on op)
- #2553 - Honor Cell Footprint in sky130hd, sky130hs and ihp (rsz)
- #2536 - Change CI to only run relevant checks (syndace)
- #2473 - make command fails inside the docker during detail routing (vijayank88)
- #1953 - Bug in ihp-sg13g2 jpeg flow (luarss)

Each issue entry includes a link, a timestamp, and a comment count.

Figure 9: ORFS issues, open and IHP in it

# Workarounds (example masked\_aes)

The README of the design example from earlier (masked\_aes) gives some basic, but sufficient information about the actual state and the workarounds.

<https://github.com/HEP-Alliance/masked-aes-tapeout/blob/main/README.md>

## The ASIC

To build the ASIC, set up OpenROAD-flow-scripts, clone this repository as `<ORFS-Root>/flow/designs/ihp-sg13g2/masked_aes` and run the build like any other ORFS design.

## Sealring

The sealring was generated using a script included with IHP's open PDK.

Clone the PDK and set up the technology in KLayout. The following command creates the sealring:

```
$ klayout -n sg13g2 -zz -r <IHP-repo-root>/ihp-sg13g2/libs.tech/klayout/tech/scripts/sealring.py -rd width=1065.0 -rc ↗
```

The generated sealring has to be moved by -60 in both directions, which can be done in KLayout.

## Caveats

Information on steps that are not fully automated yet as well as known issues.

## Metal Fill

Metal fill has to be performed on the output GDS using a KLayout script provided as part of the IHP PDK. The script is currently work-in-progress here: [IHP-GmbH/IHP-Open-PDK#229](#)

## DRC Violations

# Before your Tapeout

If you plan to do a Tapeout with open-source to a Shuttlerun at IHP:

- Get in touch with the people at IHP before submitting a GDS.
- Inform yourself about the actual changes in the tools, the PDK and the submission repositories.
- Look for recent examples from the CoreExpert Group.

# Non public and non open-source designs

## IMPORTANT NOTICE:

- Using open-source doesn't mean you have to publish your work in open-source!

With using the open-source EDA tools and the open-source IHP PDK it is possible

- to design and fabricate closed source microchips at IHP.
- to not make a design public.

If you plan to do this: Talk to IHP!

## Section 5

Contribute to open-source

# Contributing with Git

If you want to start contributing to open-source (maybe to this course?):

- Create a Git account
- Join a discussion about an issue.
- When you discover an error, write an issue yourself.

It is really not much more than a ticket-system via email.

# The Feedback to this course

Your feedback will become issues in the course repository. Join in the discussion if you want to contribute:

<https://github.com/OS-EDA/Course/issues?q=is%3Aissue>

A screenshot of a GitHub repository interface. The top navigation bar shows 'OS-EDA / Course'. Below it, the 'Issues' tab is selected, showing a count of 1. Other tabs include 'Code', 'Pull requests', 'Actions', 'Projects', 'Wiki', 'Security', 'Insights', and 'Settings'. A search bar at the top right contains the placeholder 'Type / to search'. Below the tabs, there's a 'New issue' button. The main area displays two issues: one titled 'Tutorial for the slides' opened by 'ThorKin' last week, and another titled 'Which pandoc version is needed to compile/build slides?' closed by 'sergeiandreyev' last week.

Figure 11: Issue tracking in the course repository
