Section 3

Course components

Get the course materials here:

Course materials (Release):

https://github.com/OS-EDA/Course/releases

- Download the latest release
- Unpack into a directory
- There might be daily updates during the course week!

Additional course related links:

OS-EDA Github organization:

https://github.com/OS-EDA

Course Github repository:

https://github.com/OS-EDA/Course

Duplicated content versus internet links

The course slides

- contain Links to the Internet for a lot of topics.
- do not contain duplicated content (or as less as possible).

This means:

- Follow the links and read there. It is important content for the course.
- The links are carefully curated. It's not spamming.
- Don't expect all the content beeing duplicated into the course slides.

A brief discussion about pros and cons of this.

Lectures

Lectures:

- All the chapters start with a lecture slide deck.
- The trainer will walk you trough the content of the lectures.
- Whenever you have a question inbetween: ask directly.
- The lectures contain the base knowledge of the course.

Trainings

Common training tasks:
Every training sessions starts with the common part. The tasks of the common part are sufficient to follow along the content of the course. If you're a beginner, these trainings should be your goal to reach.

Advanced training tasks:
The advanced training sessions are for those With pre knowledge. If the common training was finished fast or was just to easy, the advanced sessions get you convered.

Bonus training tasks:
Still time left to do some tasks? Want something to take with you as homework? Please enjoy the bonus rounds of the training sessions.

Questions

Questions:

- The questions are for re-visiting and remembering a previous chapter.
- They guide an interactive session between the trainer and the room:
  - Trainer: Asks the questions.
  - Room: Answers the questions.
    - Skipping a question is fine.
    - Not knowing the answer is fine.
    - This is not an exam, not a test and not a challenge.
    - It is meant as a helpfull and hoepfully enjoyable way to recap yesterdays content.
  - If no answer is found, the trainer helps with the answer.

Section 4

Feedback and Cheat Sheets

Feedback and Cheat Sheets

- We please you to give us feedback for the course.
- There is a short timeframe each day reserved for feedback.

We have two ideas about this:

1. Developing Cheatsheets together
2. Collecting general feedback

Cheetsheets

Some things are really hard to remember:

- Abbreviations
- Complex relations and graphics
- EDA tools workflow
- Schedule of the week
- Mathematics (joking, wer're not doing math here)
- …

- That is why we would like to develop Cheatsheets with you.
- They're made for cheating the hard parts.
- Cheatsheets work best when printed as handouts.
- One can have them nearby the computer while learning.

Cheatsheet example

Figure 1: Cheatsheet Chapter 1

Cheatsheet example

Cheatsheet - Chapter 5
PDK Examination

KLayout:

.lyp	Layer properties file
.lyt	Technologies file for Layout ↔ Technology mapping

XScheme:

.sym	Schematics file

Hardware Description Languages (HDL):

Verilog
VHDL
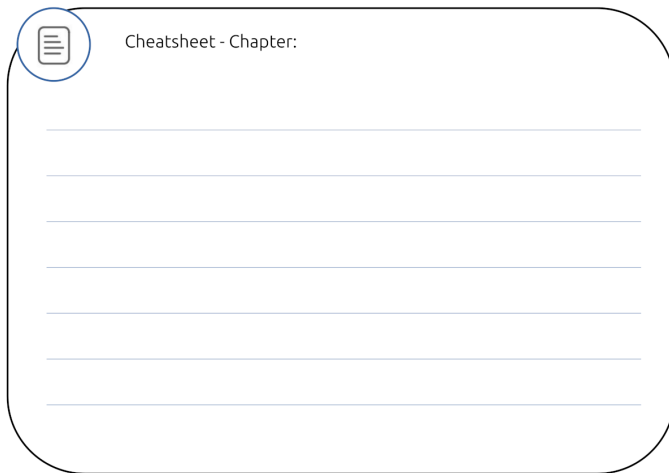

Abbreviations:

LVS	Layout versus Schematic
CDL	Circuit design language
GDS II	Graphic data system (II)
LEF	Library exchange format
techLEF	Additional info about the technology
.lib	Liberty timing file: ASCII descriptions of timing / power of cells.

Figure 2: Cheatsheet Chapter 5

Empty Cheatsheet printversion

Cheatsheet - Chapter:

Figure 3: Cheatsheet Chapter 5

General feedback

Genral feedback:

- The general feedback will be collected verbaly in the room.
- Everyone has the opportunity to give feedback
- We will write down the feedback, without your name.

What will happen with your feedback?

- We will put the feedback into Github issues.
- Right now, think of Github issues as some sort of tracker- or ticketsystem.
- Your feedback will not be connected to you (Anonymous).
- You can join a public discussion in the Github issues, if you want to.

Weblink to the issues of the course:

https://github.com/OS-EDA/Course/issues?q=is%3Aissue

Section 5

The Training sessions

Login at IHP

- Onboarding to the computers for everyone

Levels

- The Trainings should create success points inbetween lectures
- This is going too slow for me:
  - Try the advanced and bonus trainings (even from past chapters)
- This keeps me busy every minnute:
  - Stick to the common trainings. You will be able to follow all chapters then.

Section 6

Certificate

Certificate

We will explain live about the certificate of the course.

RTL: Register Transfer Level

In digital circuit design, **register-transfer level** (**RTL**) is a design abstraction which models a synchronous digital circuit in terms of the flow of digital signals (data) between hardware registers, and the logical operations performed on those signals.

Register-transfer-level abstraction is used in hardware description languages (HDLs) like Verilog and VHDL to create high-level representations of a circuit, from which lower-level representations and ultimately actual wiring can be derived. Design at the RTL level is typical practice in modern digital design.[1]

Unlike in software compiler design, where the register-transfer level is an intermediate representation and at the lowest level, the RTL level is the usual input that circuit designers operate on. In fact, in circuit synthesis, an intermediate language between the input register transfer level representation and the target netlist is sometimes used. Unlike in netlist, constructs such as cells, functions, and multi-bit registers are available.[2] Examples include FIRRTL and RTLIL.

Transaction-level modeling is a higher level of electronic system design.

RTL description [edit]

A synchronous circuit consists of two kinds of elements: registers (sequential logic) and combinational logic. Registers (usually implemented as D flip-flops) synchronize the circuit's operation to the edges of the clock signal, and are the only elements in the circuit that have memory properties. Combinational logic performs all the logical functions in the circuit and it typically consists of logic gates.

Combination logic   Register

GDS: Graphic Data System (II)

Figure 5: GDS (Screenshot from Wikipedia [2])

The GDS II Format (Specification)

Here are two links about the strcuture, format and elements of GDS II. The links are for reference reasons. It is not strictly necessary to read or learn the GDS II format for this course. But it might help understanding.

https://boolean.klaasholwerda.nl/interface/bnf/gdsformat.html

https://www.rulabinsky.com/cavd/text/chapc.html

Naming of RTL-to-GDS tools:
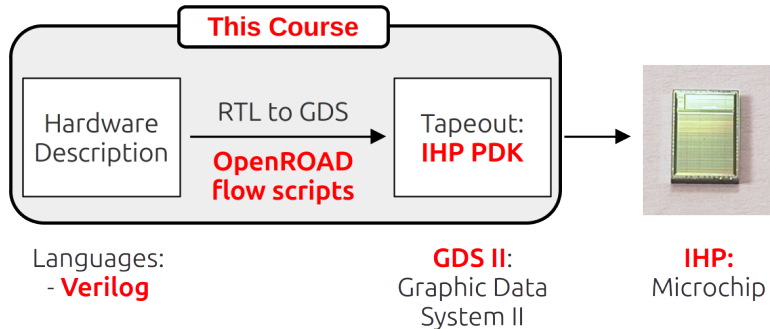

The naming of the tools is confusing:

- RTL-to-GDS
- = RTL-2-GDS
- = End-to-End-ASIC tools
- = End-to-End EDA toolchain

They all mean the same.

In this course: ORFS - OpenROAD flow scripts

This Course

| Hardware Description | RTL to GDS
 OpenROAD flow scripts | Tapeout: **IHP PDK** |

Languages:
- **Verilog**

GDS II:
Graphic Data System II

IHP:
Microchip

Many open-Source RTL-to-GDS toolchains

Most known RTL-to-GDS toolchains:

- OpenLANE
- OpenLANE 2
- Silicon Compiler
- Coriolis

Used with IHP PDK and in this course:

- OpenROAD flow scripts

which is based on

- OpenROAD

A toolchain based on scripts and configuration files

OpenROAD flow scripts are

- based on scripts (obvious in the name)
- based on configuration files

Want most developers know from the commercial tools is:

- Graphical GUIs, used with a mouse and keyboard (shortcuts).
- Configuration through graphical masks, windows, forms.

This might feel uncomfortable at the beginning. But it still has some advantages.

Section 8

Further introductionary topics

Advantages of open-source in EDA

- A word by Andrew Kahng (head of OpenROAD) about the relevance of open-source EDA

Andrews slides from the keynote speech at the Chipdesign Network June 2024. As pptx:

https://vlsicad.ucsd.edu/NEWS24/InnovationKeynote-v6-ACTUAL-DISTRIBUTED.pptx

Andrews news page with the link (scroll to june 2024) https://vlsicad.ucsd.edu/

Some aspects of open-source EDA

- Three well known PDKs are open-source and production-ready.
- Some other open-source PDKs are not that visible or prominent (MiniFab, Pragmatic(soon?), ...)
- More then one RTL-to-GDS toolchain is production tested.
- Academia starts teaching a lot with open-source EDA.
- Building microchips with open-source became easy and affordable.
- No NDAs, No licence costs, Start with a laptop and internet.

SKY130, Efabless, Google

Goals of this course.

A few words about open-source in general
